**URAMILE**, *n.* A new chemical compound discovered by Wöhler and Liebig. It is a product of the decomposition of thionuric acid, and is obtained either in the form of a crystalline powder, or in dendritic or feathery crystallizations, of a very beautiful aspect. It dissolves in ammonia and potash, and the solution absorbs oxygen, becoming purple, and depositing green crystals of murexide, or of potassium-murexide. Uramile may be considered as uric acid, in which the urea is replaced by 1 equivalent of ammonia, and 2 of water.

**URAMILIC ACID**, *n.* An acid obtained by Wöhler and Liebig, by evaporating acid thionurate of ammonia, or uramile, with dilute sulphuric acid. ## URANOSCOPUS

lemon-yellow; transparent or sub-translucent. It contains phosphoric acid, oxide of uranium, lime, silice, oxide of iron, with small quantities of magnesia, oxide of manganese and barytes, but it appears essentially to consist of the phosphates of uranium and lime. It occurs crystallized in rectangular prisms, in imperfect octahedra, &c. Its structure is lamellar, and it yields to the knife. Uranite is found in veins of granite near Autun and Limoges, in France, and also in several parts of Saxony. A green variety, called chalcocite and uran-mica, is found in Cornwall. Its colour is owing to the presence of phosphate of copper instead of phosphate of lime.

**URANITIC**, *a.* Pertaining to uranite, or resembling it.

**URANIUM**, *n.* A metal discovered by Klaproth, in 1789, who named it after the planet Uranus, the discovery of which had occurred some years before. It was obtained from the mineral called *pechblende*, which consists of protoxide of uranium, and oxide of iron. It also occurs in the form of peroxide in uranite and uran-mica. Uranium appears to be of a crystalline texture, with a metallic lustre, and of a reddish-brown colour. It suffers no change from exposure to the air at common temperatures, but when heated in open vessels it absorbs oxygen, and is reconverted into the protoxide. The properties of this metal, however, are as yet known imperfectly, and, from recent researches, it would appear that what was supposed to be the metal is an oxidised body, acting, according to Peligot, the part of a metal; while, according to others, it is the protoxide of the true metal. The oxide of uranium, or what was formerly regarded as metallic uranium, is used for giving a fine black in painting on porcelain, and the peroxide and all its compounds have rich and permanent yellow colours.

**URAN-MICA**, *n.* Green uranite, or chalcocite. [*See URANITE.*]

**URANUS**, *n.* [Gr. *ouranos*, heaven.] In myth., a divinity, the first king of the Atlantic nation, and the father of Saturn.—2. In astron., one of the primary planets, discovered by Sir William Herschel in 1781. It was the remotest known planet belonging to our system, until the discovery of the planet Neptune in 1846. It presents the appearance of a small round uniformly illuminated disc, without rings, belts, or discernible spots. To the naked eye it appears like a star of the sixth magnitude, its apparent diameter being about four seconds. Its real diameter is 35,000 miles, so that its bulk is about eighty times that of the earth. It completes its revolution round the sun in nearly 84 of our years, moving in its orbit at the rate of 15,000 miles in an hour. Its distance from the sun is 1800 millions of miles. Sir W. Herschel discovered six satellites about the planet Uranus. The existence of two of these has been clearly made out, but many have doubted the existence of the remaining four, as no one besides Herschel himself has ever been able to see one of them, except Mr. Lamont, of the observatory of Munich, who saw the sixth satellite in 1837. The orbits of the satellites of Uranus (at least of those two whose existence is certain), are nearly at right angles to the plane of the ecliptic, and their motions are retrograde, or from east to west, instead of from west to east, as is the case with every other planet and satellite. The name *Uranus* was given to this planet in allusion to the ancient mythology, according to which Uranus was the father of Saturn, as Saturn was of Jupiter, and Jupiter of Mars. It was also named Herschel in honour of the discoverer, and the Georgium Sidus, in honour of the reigning king, George III.; but the name Uranus is now universally recognised.

It is soluble both in water and alcohol, and, when heated, it melts, gives off much ammonia, and finally solidifies, being in a great measure converted into ammonia and cyanuric acid. It belongs to the class of organic bases, forming crystallizable compounds with several acids, such as nitric, oxalic, and acetic acids. It consists of 2 atoms of carbon, 4 of hydrogen, 2 of nitrogen, and 2 of oxygen.

## URINATOR

times called *lithic acid*. It occurs in small quantity in the healthy urine of man and quadrupeds, and in much larger quantity in the urine of birds. The semi-fluid urine of birds and serpents is principally composed of urate of ammonia, and guano, which is the decomposed excrement of aquatic birds, contains a large quantity of urate of ammonia. Uric acid occurs in combination with soda or ammonia in those gouty concretions, commonly called *chalk stones*, and it constitutes the principal proportion of the calculi, deposited in the human bladder, and of the red gravel or sand which is voided in certain morbid states of the urine. It is best obtained from the excrement of the boar constrictor. It crystallizes in fine scales of a brilliant white colour, and silky lustre; it is inodorous and insipid, heavier than water, and nearly insoluble in it when cold, and only slightly dissolved by it when hot; the solution reddens litmus paper, but feebly. Nitric acid dissolves uric acid, and also sulphuric acid, when concentrated. When it is dissolved in nitric acid, the solution contains alloxan, alloxantine, parabanic acid, and ammonia, and when evaporated, and treated with ammonia in excess, it acquires a purple red colour, a test by which uric acid may be recognised. It consists of 10 equivalents of carbon, 4 of nitrogen, 4 of hydrogen, and 6 of oxygen. It may be regarded as a compound of uric or cyanoxalic acid with urea. The saline compounds of uric acid are called *urates*, the most important of which are the urates of potash, soda, and ammonia.

**URILE, } n.** A radical supposed to **URYLE, }** exist in the compounds of uric acid, and to be formed of the elements of cyanogen, and those of carbonic oxide. It is also called cyanoxalic acid.

diva.] A diver; one who plunges and sinks in water in search of something, as for pearls.

**URINE, n.** [L. *urina*; Gr. *ουρον*, from *ουρα*: G. *harn*, *harnen*.] An animal fluid or liquor secreted by the kidneys, whence it is conveyed into the bladder by the ureters, and through the urethra discharged. In its natural state it is acid, transparent, of a pale amber or straw-colour, a brackish taste, a peculiar odour, and of a specific gravity varying from 1.012 to 1.030. The character of the urine, however, is apt to be altered by a variety of circumstances, and from the variety of the substances extracted from the body through the medium of the kidneys, the urinary system may be regarded as the emunctory of the entire animal economy, in which we meet with every principle and constituent that analysis has discovered, forming the solids and fluids of the body. A knowledge of the urine in health, and of the variations to which it is subject in disease, is of the utmost importance to the medical practitioner, as the different appearances of this fluid indicate not merely the state of the urinary system, but the changes which have taken place in other parts of the animal economy. According to Berzelius, 1000 parts of healthy urine contain:—water, 933 parts; urea, 30.1; uric acid, 1; free lactic acid, lactate of ammonia, and animal matters not separable from them, 17.14; mucus of the bladder, 0.32; sulphates of potash and soda, 6.87; phosphates of soda and ammonia, 4.69; muriate of soda, 4.45; muriate of ammonia, 1.50; earthy phosphates, with a trace of fluete of lime, 1; silice, 0.03. In addition to these ingredients, urine occasionally contains a variety of other substances, as sugar bile, albumen, fibrin, fat, blood, &c. No liquor in the human body is so variable, in respect to quantity or quality, as the urine. It varies even in its healthy state in respect to age, drink, food, medicines, the time of the year, the muscular motion of the body, and the affections of the mind.

At London, the *usage* for bills drawn from Holland, Germany, or France, is one month. The *usage* is very different in different countries and cities. *Double, treble, and half usage*, are terms implying corresponding alterations on the usual period.

**USE,** *n.* [*L.* *usus*; *It.* *uso*; *Fr.* *us*, plur.]

8. Interest; the premium paid for the possession and employment of borrowed money.—9. In *law*, the benefit or profit of lands and tenements. *Use* imports a trust and confidence reposed in a man for the holding of lands. He to whose *use* or benefit the trust is intended, shall enjoy the profits. All modern conveyances are directly or indirectly founded on the doctrine of *uses* and *trusts*, which has been deemed the most intricate part of the property law of England. *Uses* and *trusts*, being acts of confidence reposed, are cognizable in equity, when coupled with the performance of any act tending to the benefit of the party for whose enjoyment the *use* or trust was created.

*Uses*, as a term, is applied to lands of inheritance, and the party to whose *use* they are conveyed has the absolute possession; as if land is conveyed to A, to the *use* of B, B has by law the possession vested in him; but if land be conveyed to A, to the *use* of B in trust, to permit C to enjoy and receive the profits of the land, B has the *legal*, C the *equitable* estate; the law transferring the *use* into possession, or as is the more common mode, land is conveyed to A, to the *use* of A, in trust for B and his heirs, or to permit B to occupy, &c. *Uses* only apply to land of inheritance; no *use* can subsist of leaseholds.

—*Statute of uses*, the Stat. 27 Henry VIII. cap. 10, which transfers *uses* into possession, or which unites the *use* and possession.—*Cestuy que use*, in law, the person who has the *use* of lands and tenements.—*Executed use*, one to which the statute applies by annexing it to the legal ownership.—*Springing use*, one limited to arise on a future event, where no preceding *use* is limited.—*Future or contingent use*, one limited to a person not ascertained, or upon an uncertain event, but without derogation of an *use* previously limited.—*Resulting use*, is one which, being limited by the deed, expires or cannot vest, and results or returns to him who raised it, after such expiration.—*Secondary or shifting use*, is that which, though executed, may change from one to another by circumstances.—*In use*, in employment; as, the book is now *in use*.—2. Usurious bargains, or rather loans *morally* usurious, are often protected by lending the money upon contingency, as annuities, or making the repayment to depend upon certain lives being in existence at a particular time. The usury laws have been relaxed by several recent statutes, and bills of exchange not having more than 12 months to run, and contracts for loans or forbearance of money above 10 pounds are no longer affected by those laws. ## V.

**V** IS the twenty-second letter of the English Alphabet, and a labial articulation, formed by the junction of the upper teeth with the lower lip, as in pronouncing *av*, *ev*, *ov*, *vain*. It is not a close articulation, but one that admits of some sound. It is nearly allied to *f*, being formed by the same organs; but *v* is vocal, and *f* is aspirate, and this constitutes the principal difference between them. *V* and *w* were formerly the same letter, derived no doubt from the Oriental *vax* or *wax*, but they have now as distinct uses as any two letters in the alphabet, and are therefore to be considered as different letters. The Roman letter *v* was probably pronounced as *u*, a supposition which would explain the fact that in the alphabet of that language one character is employed for both *u* and *v*. *V* has one sound only,

as in *vary*, *vote*, *lavish*.—As a numeral, *V* stands for 5. With a dash over it, in old books, *V* stands for 5000. *V. R.*, among the Romans, stood for *uti rogas*, as you desire; *V. C.* for *vir consularis*; *V. G.* for *verbi gratia*; *V. L.* for *videlicet*. In modern abbreviations, *V.* stands for *vide*, see; also for *verb*, or *verse*; *viz.* for *videlicet*, that is to say, namely. In music for instruments, *V.* stands for *violin*; *V. V.* for *violins*. *V. S.* for *volta subito*, turn over quickly. In *her.*, *V.* is used to express *vert* or *green*, in the tricking or drawing of arms with a pen and ink.

It has been found that vaccination, in a great majority of instances, confers a complete and permanent security against small-pox, and that in those cases where the small-pox does occur after vaccination, it is generally divested of its formidable characters, and constitutes a comparatively mild disease. VACUOUS, *a.* Empty; unfilled; void.

VACUOUSNESS, *n.* The state of being empty.

VACUUM, *n.* [*L.*] Space empty or devoid of all matter or body. Whether there is such a thing as an absolute vacuum in nature, is a question which has been much controverted. The existence of a vacuum was maintained by the Pythagoreans, Epicureans, and Atomists; but it was denied by the Peripatetics, who asserted that 'nature abhors a vacuum.' Descartes also denied the possibility of a vacuum, maintaining that the essence of matter consists in extension. Some philosophers have supposed that all space beyond the atmosphere of the earth and other planets, is filled with an ethereal fluid, far more fine and subtle than air. This latter opinion receives some countenance from recent observations. It has been all but proved that a comet undergoes precisely the same sort of changes in its mean motion, which would be produced if the body moved in a medium which offered a small resistance to its motion. The undulatory theory of light which is now pretty generally received, also furnishes an argument against the existence of a vacuum, for according to this theory the whole of the celestial spaces are filled with a medium of great elasticity. The term *vacuum*, is generally used to denote the interior of a close vessel, from which the atmospheric air, and every other gas have been extracted. Thus, in experiments with the air pump, the interior of the glass receiver, after the air has been extracted by the machine, is termed a vacuum. In this case, however, the vacuum is not perfect, for from the very nature of the machine, some air must always remain in the receiver, however long the exhausting process may be continued. The most perfect vacuum which can be produced artificially is the *torricellian vacuum*, or the space above the mercury in the barometer tube, but even here the vacuum is not absolutely perfect, for although the air may be entirely excluded from the space above the mercury, there is always an atmosphere of the vapour of mercury.—*In vacuo*, in a vacuum.

*Vagrants and outlaws shall offend thy view.*

*Prior.*

# VAIMURE

*vagabonds*; 3. Incorrigible rogues. Under the first class are included, every person who refuses or neglects to maintain himself and family, he being able to do so; paupers returning without certificate to parishes from which they have been legally removed; pedlars without license, beggars, common prostitutes, &c. Under the second class, are included every person committing any offence which would constitute him an idle or disorderly person, and who has been once already convicted, fortune tellers, and other impostors; persons guilty of indecent exhibitions; persons collecting alms or money under false pretences; wanderers who have no visible means of subsistence, and cannot give a good account of themselves; persons playing at games of chance in public places; reputed thieves; persons having in their possession housebreaking implements or offensive weapons with intent to use them. Under the third class are included persons guilty of the last class of offences, having been already convicted; persons breaking out of legal confinement; every person apprehended as a rogue and vagabond, and violently resisting any constable or other peace officer, so apprehending him. For all these offences the punishment is imprisonment or hard labour for a longer or shorter period, according to the nature of the particular offence. In *Scotland*, the laws against vagrants, as beggars, fortune tellers, jugglers, minstrels, &c., are of a much less stringent nature, and such persons are seldom apprehended or punished, unless where police regulations are enforced, or where they are entering a parish in the face of an advertised prohibition, or where they are committing or in the notour habit of committing petty delinquencies.

*V. officinalis*, the official or great wild valerian, is a native of Europe, and grows abundantly by the sides of rivers, and in ditches, and moist woods, in Great Britain. The root, which is the official part, has a very strong smell, which is dependent on a volatile oil. Cats and rats are very fond of it, and rat-catchers employ it to decoy rats. It is used in medicine in the form of infusion, decoction, or tincture, as a nervous stimulant and antispasmodic. For a figure of this plant, see *Triander*. *V. rubra*, or red valerian, is occasionally found wild in Britain, and is cultivated in gardens as well as many other species, on account of its elegant flowers. *V. phu* is the garden valerian, and *V. discoroidis* the ancient Greek valerian.

The principal genera are *Valeriana*, *Valerianella* (the *Fedia* of Adamson), and *Nardostachys*, or spike-nard. The name *valerian* is given to *Polemium ceruleum*.

**VALERIANELL'IA,** *n.* A genus of plants; nat. order Valerianaceæ. The species of this genus have been described by Smith, Hooker, and others, under the Adansonian genus *Fedia*; but DeCandolle, Lindley, and other systematic botanists, retain *valerianella*, which is a diminutive of *valeriana*, and restrict the genus *Fedia* to a single species, the *F. cornucopia*. Four species of *valerianella* are British. *V. olitoria*, common corn-salad, or lamb's lettuce, is an annual plant, found abundantly in corn fields and cultivated ground in Great Britain. **VALUE**, *n.* (*val'u.*) [Fr. *valoir*, *valu*; from *L. valor*, from *valeo*, to be worth; *It. valere*; *Sp. valor*.] 1. Worth; that property or those properties of a thing which render it useful or estimable; or the degree of that property or of such properties. The *real* value of a thing is its utility, its power or capacity of procuring or producing good. Hence, the *real* or *intrinsic* value of iron is far greater than that of gold. But there is, in many things, an *estimated* value, depending on opinion or fashion, such as the *value* of precious stones. The *value* of land depends on its fertility, or on its vicinity to a market, or on both.—2. Price; the rate of worth set upon a commodity, or the amount for which a thing is sold. We say, the *value* of a thing is what it will bring in

1151

## VALUE

market.—3. In *political economy*, the quantity of labour, or of the product of labour, which will exchange for a given quantity of labour, or of some other product thereof. It is the labour of man alone which in ordinary circumstances creates value, and becomes the real measure of the exchangeable value of all commodities. It is necessary here to distinguish utility from value, or, as Adam Smith expresses the distinction, "*value in use*" from "*value in exchange*." The former may be defined, the power or capacity of an article to satisfy our wants or gratify our desires, while the *value in exchange* is that which will be received as an equivalent for something else which it has taken some labour to produce or obtain. What all may enjoy alike without labour may indeed be most useful and necessary, but cannot be an object of exchange, and therefore is destitute of value. Water is indispensable to existence, and has therefore a very high degree of utility or of *value in use*; but as it can generally be obtained in large quantities without much labour or exertion, it has, in most places, but a very low value in exchange. Gold, on the contrary, is of comparatively little utility; but as it exists only in limited quantities, and requires a great deal of labour on its production, it has a comparatively high exchangeable value, and may be exchanged or bartered for a proportionally large quantity of most other things. The real value of a commodity depends solely upon the quantity of labour necessary for its production, and the exchangeable value never varies materially either above or below the real value; hence it follows that the price paid for labour does not affect the exchangeable value of articles produced under similar circumstances. Every reduction in the quantity of labour required to produce a commodity diminishes its real value, and hence its value in exchange; and, upon the same principles, every increase in the quantity of labour, directly or indirectly applied, adds to the value of a commodity.—4. Worth; *applied to persons*.

Ye are all physicians of no value; Job xiii.

Ye are of more value than many sparrows; Matt. x.

5. High rate.

Cesar is well acquainted with your virtue, And therefore sets this value on your life.

2. In *mech.*, a kind of movable lid, or cover adapted to the orifices of a tube, or passage into a vessel, for the purpose of regulating the admission or escape of a fluid, such as water, gas, or steam. Some valves are self-acting, that is, they are so contrived as to open in the required direction, by the pressure of the fluid upon their surface, and immediately to shut and prevent the return of the fluid when the direction of its pressure changes. Others are actuated by independent external agency. Examples of the former kind are presented in the valves of pumps, and in the safety-valves of steam boilers, and of the latter, in the slide-valves appended to the cylinder of a steam engine for the purpose of regulating the admission and escape of the steam. The construction of valves admits of an almost endless variety. [*See CUR-VALVE, CLACK-VALVE, CONICAL VALVE, D-VALVE, SAFETY-VALVE, THROTTLE VALVE.*]

3. In *anat.*, a membranous partition within the cavity of a vessel, which opens to allow the passage of a fluid in one direction, and shuts to prevent its reërritation; as the *valve* of the colon, *mitral valve*, *semilunar valves*, *tricuspid valves*, &c.—4. In *bot.*, the outer coat, shell, or covering of a capsule or other pericarp, or rather one of the pieces which compose it; also, one of the leaflets composing the calyx and corol in grasses. The same term is also applied to the opening in the cells of anthers, which occurs when the pollen is about to be discharged.—5. In *conchology*, the shell. When the whole shell is in one piece, it is called an *univalve*; when in two pieces a *bivalve*; and when of more than two pieces, a *multivalve*.

**VAMP'ING**, *ppr.* Piecing with something new.

**VAMPIRE**, *n.* [*G. vampyr.*] 1. According to Dohn Calmet, the *vampire* is a dead man who returns in body and soul from the other world, and wanders about the earth doing every kind of mischief to the living. Generally he sucks the blood of persons asleep, and thus causes their death, while those who are destroyed in this manner become themselves vampires. The only way of getting rid of such visitors, is, according to the same author, to disinter their bodies, to pierce them with a stake cut from a green tree, to cut off their heads, and to burn their hearts. This superstition is chiefly prevalent in some parts of Eastern Europe, and especially in Hungary and its dependencies.—2. In *zool.*, the Linnean trivial or specific name of *Pteropus Edwardsii*, or the great bat of Madagascar; also, the popular name of *Phyllostoma spectrum*, or the *Vampyre bat* of New Spain; also, the popular name of the genus of bats, named

Vampyre (Phyllostoma spectrum).

*Vampyrus*. Bats of the genus *Phyllostoma* have a leaf-like appendage attached to their upper lip, whence their name. The tongue is capable of considerable extension, and is furnished at its extremity with a number of papillæ, apparently arranged so as to form an organ of suction. These animals grow to a great size, specimens having been killed measuring two feet between the tips of the wings. They attack horses and cattle, and sometimes even man, during the night, puncturing their skin, it is supposed, by means of the hooked nail of the thumb, and then abstracting the blood by the suction powers of their lips and tongue. In some parts of Brazil the ravages of these creatures

are such as to render the rearing of cattle an impossibility. It is more than probable, however, that the celebrated vampire superstition, and the blood-sucking qualities attributed to the bat, have some connection with each other.

**VANA'DIATE**, *n.* A salt formed by the union of vanadic acid with a base; as, *vanadate* of lead.

**VANA'DIC ACID**, *n.* An acid obtained by heating vanadate of ammonia so as to expel the alkali. Its colour in the state of fine powder is a light rust yellow; but when fused, it is red with a shade of orange, and has a strong lustre. It is tasteless, nearly insoluble in water, and quite so in alcohol. With bases it forms salts, which are either red or yellow, according as they are acid or neutral salts; but the neutral vanadates of the alkalis may occur both yellow and colourless, without any known difference in composition. Vanadic acid consists of 3 equivalents of oxygen, and 1 of vanadium.

**VANA'DIUM**, *n.* [*from Vanadis, a Scandinavian deity.*] A metal discovered by Sefström in 1830, in iron prepared from the iron ore of Taberg, in Sweden. It was afterwards obtained by the same individual in the slag formed during the conversion of the cast-iron of Taberg into malleable iron. It has since been found in a lead ore from Wanlockhead, in Scotland, and in a similar mineral from Zimapan, in Mexico. This metal has a white colour, and a strong metallic lustre, considerably resembling silver, but still more like molybdenum. It is extremely brittle. It is not oxydized either by air or water, though by continuous exposure to the atmosphere, its lustre grows weaker, and it acquires a reddish tint. The only acid that dissolves it is aqua regia. Oxygen and vanadium combine to form two oxides, viz., the protoxide, which is a black powder, having a semi-metallic lustre, and the deutoxide, which, when anhydrous, is also black, but forms blue salts. With chlorine, vanadium forms a dichloride, and a tetrachloride.

**VAPOROUSNESS**, *n.* State of being full of vapours.

**VAPOUR**, *n.* [L. and Sp. *vapor*; Fr. *vapeur*; It. *vapore*.] It is probably from a verb signifying to depart, to fly off.] 1. In a general sense, an invisible elastic aeriform fluid, into which any body naturally solid or liquid at ordinary temperature may be converted by the agency of heat, and which is capable of being condensed or brought back to the liquid or solid state, by reducing the temperature, or by a moderate increase of pressure. Vapours are distinguished from gases by their ready conversion into liquids or solids, whereas gases retain their elastic state more obstinately; they are always gaseous at common temperatures; and, with one or two exceptions, cannot be made to change their form, unless by being subjected to much greater pressure than they are naturally exposed to. Several of them, indeed, have hitherto resisted every effort to compress them into liquids. Different substances yield vapours with very different degrees of facility; fluids in general are more easily vaporized than solids, and solids generally pass into the liquid state before they assume the form of vapour. Some liquids, ether for instance, require to be carefully secluded from the atmosphere, to prevent their rapid conversion into vapour. The vapour which is produced by the ebullition of water is distinguished by the name of *steam*,—which see.—2. A visible fluid floating in the atmosphere. All substances which impair the transparency of the atmosphere, as smoke, fog, &c., are in common language called *vapours*.—3. In meteorology, that invisible elastic fluid which rises constantly from the surface of land and water all over the

world, at common temperatures, and which, uniting itself to the air, ascends into the higher regions of the atmosphere, and is carried by the winds to great distances. Aqueous vapour thus suspended in the atmosphere, when condensed by cold, becomes visible, forming clouds, and returning to the earth in the form of rain, snow, &c. The formation of vapour at the surface of land and water is promoted by an increase of temperature, by winds, and by the dryness of the atmosphere. When the atmosphere is already saturated with aqueous vapour, the formation of vapour goes on slowly. [See **EVAPORATION**.]—3. Substances resembling smoke, which sometimes fill the atmosphere, particularly in America during the autumn.—4. Wind; flatulence.—5. **VARIABLE**, *a.* [Fr. *Vary*.] That may vary or alter; capable of alteration in any manner; changeable; as, *variable* winds or seasons; *variable* colours.—2. Susceptible of change; liable to change; mutable; fickle; unsteady; inconstant; as, the affections of men are *variable*; passions are *variable*. His heart I know, how *variable* and vain.

*Milton*.

*Variable quantities*, in *analysis*, are such quantities as are subject to continual increase or diminution, in opposition to those which are *constant*, remaining always the same. Thus, the abscissas and ordinates of a curve are *variable quantities*; because they vary or change their magnitudes together, and in passing from one point to another, their values increase or diminish according to the law of the curve. *Variable quantities* are usually denoted by the last letters of the alphabet, *x*, *y*, *z*, while those that are constant are denoted by the first letters, *a*, *b*, *c*. In the investigation of the relation which varying and dependent quantities bear to each other, the conclusions are more readily obtained by expressing only two terms in each proportion, than by retaining the four; but it must be kept constantly in mind that four quantities in the shape of a proportion are always understood; namely, each of the two *variable quantities* at different periods of their increase or decrease. One quantity is said to *vary directly* as another, when the two quantities depend wholly upon each other, and in such a manner that if one of them be increased or diminished, the other is increased or diminished in the same proportion. Thus, if the altitude of a triangle be *invariable*, the area *varies directly* as the base; for if the base be increased or diminished, the area is increased or diminished in the same proportion. One quantity is said to *vary inversely* as another, when the former cannot be changed in any manner, but the reciprocal of the latter is changed in the same proportion. For example, if the area of a triangle be given, the base *varies inversely* as the perpendicular altitude. Thus, if *A* denote the altitude of a triangle whose area is given, and *n* its base, then *A* varies as  $\frac{1}{n}$ , or  $A \propto \frac{1}{n}$ .

One quantity is said to *vary as two others jointly*, when it increases or decreases as the product of those two quantities increases or decreases. For example, the area of a triangle varies as its base and altitude jointly; thus, if *A* denote the area of a triangle, *n* its base, and *o* its altitude, then *A* varies as *n* *o*, or  $A \propto n o$ . One quantity is said to *vary directly*, as a second, and *inversely*, as a third, when the first cannot be changed in any manner, but the second multiplied by the reciprocal of the third, is changed in the same proportion. For example, the base of a triangle varies as the area directly, and as the perpendicular altitude inversely; thus, if *A* denote the area, *n* the base, and *o* the altitude, then *A* varies as  $n \times \frac{1}{o}$ , or  $A \propto \frac{n}{o}$ . In general, if one quantity varies as another, it is equal to it multiplied by

## VARIATION

some constant quantity. Thus, if  $A$  vary as  $B$ , and  $c$  be a constant quantity, then  $A = cB$ , or if  $A$  vary as  $\frac{1}{B}$ , then  $A = \frac{c}{B}$ . In *mech.*, a *variable motion* is that which is produced by the action of a force which varies in intensity.

**VARIABLE**, *n.* In *math.*, a quantity which is in a state of continual increase or decrease. The indefinitely small quantity by which a variable is continually increased or diminished, is called its *differential*, and the method of finding these quantities, the *differential calculus*.

**VARIABLENESS**, *n.* Susceptibility **VARIABILITY**, *s.* of change; lability; or aptness to alter; changeableness; as, the *variableness* of the weather.—2. Inconstancy; fickleness; unsteadiness; levity; as, the *variableness* of human passions.

**VARIABLY**, *adv.* Changeably; with alteration; in an inconstant or fickle manner.

**VARIANCE**, *n.* [See *VARY*.] In *law*, an alteration of something formerly laid in a writ; or a difference between a declaration and a writ, or the deed on which it is grounded. In ordinary language, a departure in the oral evidence from the statement in the pleadings, is termed a *variance*.—2. Any alteration or change of condition.—3. Difference that produces dispute or controversy; disagreement; dissension; discord. A mere *variance* may become a war. Without a spirit of condescension, there will be an everlasting *variance*.—*At variance*, in disagreement; in a state of difference or want of agreement.—2. In a state of dissension or controversy; in a state of enmity.

Our opinions are subject to continual *variations*.

The essences of things are conceived not capable of such *variation*. *Locke*.

2. Difference; change from one to another.

In some other places are born more females than males; which, upon this *variation* of proportion, I recommend to the curious. *Graunt*.

3. In *gram.*, change of termination of nouns and adjectives, constituting what is called case, number, and gender; as, the *variation* of words.—4. Deviation; as, a *variation* of a transcript from the original.—5. In *astron.*, the variation of the moon is the third inequality in her motion; by which, when out of the quadratures, her true place differs from her place twice equated. It depends on the angular distance of the moon from the sun.—6. In *geography* and *navigation*, the deviation of the magnetic needle from the true north point, or the angle which the magnetic needle makes with the plane of the geographical meridian of a ship or station; called also *declination*. In *navigation*, the variation

## VARIEGATING

of the compass is properly the angle between the magnetic axis of the needle and a meridian line passing parallel to the horizon through the centre of the compass. The variation of the compass does not remain constantly the same in the same place, but undergoes a slow and progressive change. The needle is observed to move gradually towards the west of the true meridian until it arrives at its maximum on that side; it then returns, passes over the true meridian, and moves easterly, until it arrives at its maximum towards the east, when it returns as before. In the year 1580, in London, the variation was  $11^{\circ} 15'$  East; in 1680, the needle pointed due north, since which time it has travelled about  $24\frac{1}{2}^{\circ}$  to the westward, and now it has begun to return. The variation however is very different in different parts of the globe, and it is also subject to diurnal changes in the same place.—7. In *music*, the different manner of singing or playing the same air or tune, by subdividing the notes into several others of less value, or by adding graces, yet so that the tune itself may be discovered through all its embellishments.—*Variation of curvature*, in *analytical geometry*, is that inequality or change which takes place in the curvature, in passing from one point of a curve to another. All curves are liable to this variation, with the exception of the circle in which the curvature is uniform at every point.—*Calculus of variations*, a branch of analysis, the chief object of which is to find what function of a variable will be a maximum or minimum on certain prescribed conditions. This calculus offers the only general, and frequently the only possible, means of solving those problems generally termed isoperimetrical.

6. In *nat. hist.*, a subdivision of a species; any individual plant or animal which differs from the rest of the species to which it belongs, in some accidental circumstances, which are not permanent, nor invariable, nor essential to the species. In *bot.*, the character of the species is found in its capability of reproducing by seed a plant which is more like itself than it is like any thing else; and this under all circumstances in which the offspring is capable of being produced. The variety differs from the species in points of structure, which are developed only under certain circumstances, arising from climate, cultivation, and other influences, and which are not essential to the species. While species having the normal form and colours, are perpetuated by seed, varieties, although often also propagated in the same manner, are liable to return to the original form, or to deviate into others, so that a variety cannot be preserved without much care. All species have a tendency to form varieties, but all the natural varieties of plants are nothing like so numerous, as those which arise from cultivation. In *zool.*, varieties, are individuals of the same species, which differ from the specific type, in size, colour, form, and relative proportion of the parts of the body, owing to the operation of different causes; as, age, climate, food, locality, domestication, &c.; but which like the varieties of plants, are liable to revert to the original typical form, in successive generations.—7. 1. A solution of resinous matter, forming a clear limpid fluid, capable of hardening without losing its transparency, and used by painters, gilders, cabinet-makers, &c., for coating over the surface of their work, in order to give it a shining, transparent, and hard surface, capable of resisting in a greater or less degree the influences of air and moisture. The resinous substances most commonly employed for varnishes are mastic, sandarac, lac, benzoin, copal, amber, and asphaltum; and the solvents employed are alcohol, volatile oil, or fixed oil. Hence, varnishes may be divided into three classes, alcoholic or spirit varnishes, volatile-oil varnishes, and fixed-oil varnishes. But as the materials to which varnishes are applied, and the purposes they are designed to answer, differ very widely, varnishes of course vary in a similar degree, and receive different names accordingly. Amber varnish is made of amber, linseed oil, litharge, and turpentine. Black varnish, for japaning wood and leather, is made by mixing lampblack with a proper quantity of a strong solution of lac in spirit of wine.—2. Many of them belong to the nat. order Anacardiaceae; as the marking nut (*Semecarpus anacardium*); *Stigmaphys vernici-flua*, which yields the Japan lacquer; *Augia sinensis*, said to produce the genuine Chinese varnish, with which the different fancy articles are lacquered; and *Rhus vernix*, the Japan varnish of Kämpfer and Thunberg.

## VEGETABLE

**VEERINGLY**, *adv.* Changingly; shift-  
ingly.

**VEGETABILITY**, *n.* [from *vegetable*.]  
Vegetable nature; the quality of growth  
without sensation.

**VEGETABLE**, *n.* [Fr. from *vegeter*, *L. vigeo*, to grow.] 1. A plant; an or-  
ganized body destitute of sense and  
voluntary motion, deriving its nourish-  
ment through pores on its outer sur-  
face or vessels, in most instances ad-  
hering to some other body, as the earth,  
and in general, propagating itself by  
seeds. Some vegetables have sponta-  
neous motion. Vegetables alone have  
the power of deriving nourishment from  
inorganic matter, or organic matter  
entirely decomposed. [See **PLANT**.]—  
2. In a more limited sense, vegetables  
are such plants as are used for culinary  
purposes and cultivated in gardens,  
or are destined for feeding cattle and  
sheep. Vegetables for these uses are  
such as are of a more soft and fleshy  
substance than trees and shrubs; such  
as cabbage, cauliflower, turnips, pota-  
toes, peas, beans, &c.

**VEGETABLE**, *a.* Belonging to plants;  
as, a vegetable nature; vegetable quali-  
ties; vegetable juices.—2. Consisting of  
plants; as, the vegetable kingdom.—  
3. Having the nature of plants; as, a  
vegetable body.—*Vegetable anat.*, that  
branch of botany which treats of the  
form, disposition, and structure of the  
organs of plants.—*Vegetable life*, the  
aggregate of the phenomena exhibited  
by plants, and which are similar to  
those that in animals are considered as  
characteristic of vital agency, agreeing  
with them in many essential respects,  
though they differ in others, especially  
in the absence of sensibility and volun-  
tary motion. Plants breathe, feed,  
digest, increase in their dimensions,  
produce new individuals, and perform  
various other functions, analogous to  
those of animals, and which are essen-  
tially characteristic of life.—*Vegetable  
earth*, soil in which decayed vegetable  
matter is in much larger proportion  
than the primitive earths.—*Vegetable  
kingdom*, that division of natural his-  
tory which embraces the various or-  
ganized bodies to which we indiffer-  
ently give the names of *vegetables* and  
*plants*. The science which treats of  
these is termed *Botany*,—which see.—  
*Vegetable marrow*, the fruit of a species  
of gourd, *Cucurbita ovifera*, a native  
of Persia. It is used for culinary pur-  
poses, and so named from the peculiar  
tenderness and softness of its flesh.—  
*Vegetable ivory*, a close-grained and  
very hard vegetable substance, resem-  
bling the finest ivory in texture and  
colour, and often wrought into orna-  
mental work. It is the produce of a  
species of palm, *Phytelephas macrocar-  
pas*, in the form of a nut, often as large  
as a hen's egg.—*Vegetable physiology*,  
that branch of botany which treats of  
the vital actions of plants, or of the  
offices which their various organs per-  
form.—*Vegetable morphology*. [See  
**MORPHOLOGY**.]—*Vegetable tissues*  
[See **TISSUE**.]—*Vegetable acids*, acids  
obtained from plants, as vinegar, malic,  
citric, gallic, &c., acids.—*Vegetable  
alkalies*, such as are obtained from  
vegetables; as, morphia, cinchona,  
strychnia, &c.—*Vegetable butters*, the  
concrete oil of certain vegetables, so  
named from its resemblance to the  
butter obtained from the milk of ani-  
male, and from being employed for

## VEHEMENCE

similar purposes. The most important  
vegetable butters are produced by the  
*Bassia butyracea*, the *Coccoloba butyragra*,  
and the *Elais guineensis*.—*Vegetable  
oils*. [See **OIL**.]—*Vegetable wax*. [See  
**WAX**.]

**VEGETAL**, *a.* Having power to cause  
growth. As a noun, a vegetable.

**VEGETARIAN**, *n.* One who abstains

*vegeter*; from *L. vigeo*, to flourish.]  
To sprout; to germinate; to grow; as  
plants; to grow and be enlarged by  
nutriment imbibed from the earth, air,  
or water, by means of roots and leaves.  
Plants will not *vegetate* without a cer-  
tain degree of heat; but some plants  
*vegetate* with less heat than others.  
Potatoes will *vegetate* after they are  
pared, provided what are called the  
eyes or chits are not removed or in-  
jured.

See *dying vegetables life sustain*.

See *life dissolving vegetate again*. *Pope*.

**VEGETATING**, *ppr.* Germinating;  
sprouting; growing; as plants.

**VEGETATION**, *n.* [Fr.] The process  
of growing, as plants, by means of  
nourishment derived from the earth,  
or from water and air, and received  
through roots and leaves. We observe  
that vegetation depends on heat and  
on certain substances which constitute  
the nutriment of plants. Rapid *vegeta-  
tion* is caused by increased heat and  
a rich soil.—2. Vegetables or plants  
in general. In June, *vegetation* in our  
climate wears a beautiful aspect.—  
*Vegetation of salts*, so called, consists in  
certain crystalline concretions formed  
by salts, after solution in water, when  
set in the air for evaporation. These  
concretions appear round the surface  
of the liquor, affixed to the sides of the  
vessel.

table; having the nature of plants; as,  
*vegetive life*. [Little used.]

**VEGETIVE**, *n.* A vegetable.

**VEGETO-ANIMAL**, *a.* Partaking of  
the nature both of vegetable and ani-  
mal matter. *Vegeto-animal matter* is  
a term formerly applied to vegetable  
gluten, which is found in the seeds of  
certain plants, in a state of union with  
fecula or starch. It is remarkably  
elastic, and when dry, semi-transpa-  
rent. By distillation it affords, like  
animal substances, ammonia, and an  
empyreumatic oil.

**VEGETOUS**, *a.* Vigorous; lively;  
vegetive.

from *veho*, to carry, that is, to rush or  
drive.] 1. Violence; great force; pro-  
perly, force derived from velocity; as,  
the *vehemence* of wind. But it is ap-

## VEIN

plied to any kind of forcible action;

in which any thing is or may be car-  
ried; any kind of carriage moving on  
land, either on wheels or runners.  
This word comprehends coaches, cha-  
riots, gigs, sulkies, waggons, carts of  
every kind, sleighs, and sledges. These  
are all *vehicles*. But the word is more  
generally applied to wheel carriages,  
and rarely we believe to water craft.—  
2. That which is used as the instru-  
ment of conveyance. Language is the  
*vehicle* which conveys ideas to others.

**VEIN**, *n.* [Fr. *veine*; *It. vena*, from the  
root of *venio*, to come, to pass. The  
sense is a passage, a conduit.] 1. In  
*anat.*, a long membranous canal which  
continually becomes wider, does not  
pulsate, and returns the blood from  
the arteries to the heart. The veins  
may be arranged in three divisions:  
1. Those that commence from the  
capillaries all over the body, and re-  
turn the blood to the heart; 2. The  
pulmonary veins; 3. The veins of the  
vena portæ, in which the blood that  
has circulated through the organs of  
digestion is conveyed to the liver.  
The veins are composed, like arteries,

## VELL

of three tunics or coats, which are much more slender than in the arteries, and are supplied internally with semilunar membranes or folds, called valves. All veins originate from the extremities of arteries, or, more properly speaking, from the capillary vessels which connect the veins and arteries, and terminate in the auricles of the heart. Their use is to return the blood from the arteries back to the heart.—2. In *plants*, a tube or an assemblage of tubes, through which the sap is transmitted along the leaves. The term is more properly applied to the finer and more complex ramifications, which interbranch with each other like net-work; the larger and more direct assemblages of vessels being called *ribs* and *nerves*. Veins are also found in the calyx and corol of flowers. The vessels which branch or variously divide over the surface of leaves are called *veins*.—3. In *geol.* and *mineral.*, cracks or fissures in rocks, filled up by substances different from the rock, and which may either be earthy or metallic. Veins are sometimes many yards wide, having an extent of many miles, and they ramify or branch out into innumerable smaller parts, often as slender as threads, like the veins of an animal; hence their name. Metallic veins are chiefly found in the primary, and lower, and middle secondary rocks. Many species of stones, as granite, porphyry, &c., are often found in *veins*.—4. A streak or wave of different colour, appearing in wood, marble, and other stones; variegation.—5. A cavity or fissure in the earth or in other substance.—6. ## VELVET

but it never came into general use—2. A name given to a boat, car, or other vehicle, which moves with rapidity.—3. Any thing which moves with velocity.

VELOCITY, *n.* [Fr. *velocité*; L. *velocitas*, from *velox*, swift, allied to *volo*, to fly.] 1. Swiftmess; celerity; rapidity; as, the *velocity* of wind; the *velocity* of a planet or comet in its orbit or course; the *velocity* of a cannon ball; the *velocity* of light. In these phrases, *velocity* is more generally used than *celerity*. We apply *celerity* to animals; as, a horse or an ostrich runs with *celerity*, and a stream runs with *rapidity* or *velocity*; but bodies moving in the air or in ethereal space, move with greater or less *velocity*, not *celerity*. This usage is arbitrary, and perhaps not universal.—2. In *physics*, velocity is that affection of motion by which a body moves over a certain space in a certain time; or, it is the measure of the degree in which a body moves quickly or slowly; that is, on a body is said to have a greater velocity than another, when it moves over a greater space in the same time, or an equal space in a less time. The velocity of a body is *uniform* when it passes through equal spaces in equal times, and it is *variable* when the spaces passed through in equal times are unequal. The velocity of a body is *accelerated* when it passes through a greater space in equal successive portions of time; and it is *retarded*, when a less space is passed through in each successive portion of time.—*Absolute velocity* is that in which the velocity of a body is considered simply in itself or as passing over a certain space in a certain time.—*Relative velocity* is that which has respect to the velocity of another moving body.—*Angular velocity*, the velocity of a body revolving about a fixed point or axis, or oscillating about a fixed point. The angular velocity of a planet is estimated by the angle described at the centre of the sun, by a straight line drawn from that point to the planet, called the *radius rector*.—*Initial velocity*, the velocity with which a body begins to move. When the motion of a body is uniform, its velocity is measured by the space described by it in a unit of time, as one second. If the motion of the body is not uniform, its velocity is measured by the space which it would describe uniformly in a given time, if the motion became and continued uniform from that instant of time. The unit of space and time taken in order to measure velocity, may be assumed of any magnitude, but in theoretical mechanics, one second is usually taken as the unit of time, and one foot as the unit of space; so that if a body is said to have a velocity of 25, it is implied that the body is moving at such a rate as would cause it to describe uniformly 25 feet in one second.—*Virtual velocities*.—[See under VIRTUAL.]

This was formerly supposed to be done by forming the articulations in the cavity of the chest or of the belly; hence the name. Ventriloquism may be regarded as a species of vocal mimicry of sounds, by which an illusion is produced on the hearer, who imagines that the sound comes, not from the mimic, but from some other appropriate source, at a given or varying distance, and in any or even several directions successively. To make the illusion perfect, the imitations require to be made without moving the lips, features, or body. The art of the ventriloquist is said to consist merely in this: after drawing a long breath so as to fill the lungs with air, he employs during expiration, such organs of voice as can be used with as little movement of the lips, mouth, or cheeks as is compatible with the pronunciation of certain words or sounds. By a dexterous management of the tones of his voice in uttering such words or sounds in the way described, he easily leads his hearers to imagine that the sounds come from a person in a box, or up the chimney, or from inanimate objects, and, to aid the deception, he endeavours by various contrivances to divert the attention of his auditors. The word *Ventriloquy* is little used.

**VEN'UE**, *n.* [*L. vicinia*; *Norm. viene*.] In *law*, a neighbourhood or near place; the place where an action is laid. The county in which the trial of a particular cause takes place, is said to be the *venue* of that cause. Originally jurors were summoned from the immediate neighbourhood where a fact happened, to try it by their own knowledge, but they are now summonable from the body of the county. In what are termed *local actions*, the actual place in which the subject matter is situated must be laid as the *venue* in the action; but in those actions termed *transitory*, that is, actions of debt, contract, for personal injuries, &c., any county may be laid as the *venue* in the action. In *criminal trials*, the *venue* is the county in which the offence charged was actually committed. The courts, however, have a discretionary power of changing the *venue*, both in civil and criminal cases.

**VEN'UE**, *n.* A thrust. [See *VENGEY*.]

or irritate. These affinities lead to the true origin of these words. The primary sense of the root is to shoot or rush, as light or wind. From light is derived the sense of white, fair, Venus, or it is from opening, parting; and from rushing, moving, comes *wind*, and the sense of raging, fury, whence *L. venenum*, poison, that which frets or causes to rage. These words all coincide with *L. venio*, which signifies to rush, to fall, to happen; *venor*, to hunt, &c. The Greeks had the same idea of the goddess of love, viz., that her name signified fairness, whiteness, and hence the fable that she sprung from froth, whence her Greek name *Αφροδιτη*, from *αφρος*, froth. But Venus may be from lust or raging.] 1. In *myth.*, the goddess of beauty and love; that is, beauty or love deified; just as the Gaelic and Irish *diana*, swiftness, impetuosity, is denominated the goddess of hunting. The poets mention two of the name Venus, the elder daughter of Uranus and the younger daughter of Jupiter and Dione, but the events in the history of the two are often confounded. She is represented by the Greeks as the highest ideal of female beauty and love, sometimes entirely naked and sometimes but slightly covered. The most famous antique statue of Venus

Venus of Canova.

is the *dé Medici* found in the Villa Hadriana at Tivoli, and one of the most famous modern statues of this goddess is the Venus of Canova, where she is represented as rising from the bath.—2. In *astron.*, one of the inferior planets, the second in order of distance from the sun, and the most brilliant of all the planetary bodies. From her alternate appearance in the morning and evening, she was called by the ancients *Lucifer* and *Hesperus*, the morning and evening star. The distance of Venus from the sun is about 68 millions of miles; her diameter 7700 miles; and her period of revolution round the sun about 224 mean solar days. She revolves about an axis, and the time of rotation is about 23° 21', the axis of rotation being inclined to the ecliptic at an angle of about 75°. Her greatest angular distance from the sun is from 45° to 47° 12'. According to her various positions relatively to the sun and earth, she changes her phases like the moon, appearing *full* at the superior conjunction, *gibbous* between that point and the points of her greatest elonga-

tion, *half-mooned* at these points, and *crenate-shaped* or horned between these and the inferior conjunction. Venus is sometimes seen to pass over the disc of the sun, and this passage is called a *transit of Venus*. [See *TRANSIT*.]—3. In the old chemistry, a name given to copper.—4. The question of the court is, whether you know the witness to be a man of *veracity*. We rely on history, when we have confidence in the *veracity* and industry of the historian. "The *veracity* of facts," is not correct language. Truth is applicable to men and to facts; *veracity* to men only, or to sentient beings.—2. Invariable expression of truth; as, the *veracity* of our senses.

**VERANDA**, *n.* An Oriental word **VERAN'DAH**, denoting a kind of open portico, or a sort of light external gallery in front of a building with a sloping roof, supported on slender pillars, and frequently partly enclosed in front with lattice-work. The *V. viride* of North America is an acrid emetic and powerful stimulant, followed by sedative effects.

When the action expressed by a verb is exerted on an object, or terminates upon it, the act is considered as passing to that object, and the verb is called *transitive*; as, I *read* *livy*. When the act expressed by the verb, terminates in the agent or subject, the verb is called *intransitive*; as, I *run*; I *walk*; I *sleep*. by causing the husks and stalks of the grape, after wine-making, to ferment in contact with copper plates, by which means a coat of verdigris was formed on the surface of the copper. It is now prepared in England by more direct processes, principally by alternating copper plates and pieces of coarse woollen cloth previously soaked in crude pyroligneous acid. Verdigris, when pure, is in the form of light blue acicular crystals of a silky lustre. It is decomposed by the stronger acids, by the alkalies, and by heat. It is much employed as a pigment in hat-making, dyeing black, in several processes in the chemical arts, and in medicine. Verdigris, like all the compounds into which copper enters, is poisonous. The vernation is said to be *conduplicate*, when the leaf is folded lengthwise, one half applied against the other, so that their margins correspond; *revolute* when the leaves are rolled backwards on each side; *involute*, when the edges of the leaves are rolled inward, spirally on each side; *convolute*, when two conduplicate leaves clasp each other; *circumvolute*, when the leaves are rolled from the tip downwards; *plicate*, when the leaves are folded lengthwise in several plaits; *equitant*, when the leaves overlap each other alternately and entirely; and *imbricate*, when the leaves overlap each other, so that the middle of the outer leaf is opposite to the edges of two inner.

**VER'NIER**, *n.* [From the inventor, Peter Vernier.] A small movable scale, running parallel with the fixed scale of a quadrant, barometer, or other graduated instrument, and having the effect of subdividing the divisions of that instrument into more minute parts. The diagram represents the vernier of the common barometer for measuring to the hundredth of an inch. The scale *A B* is divided into inches, and tenths of inches; the small movable scale *C D* is the vernier, and consists of a length of eleven parts of *A B*, divided into ten parts, each part being therefore equal to one and one-tenth of the divisions upon *A B*, and the difference between any division on the scale and vernier will be one-hundredth of an inch. In the figure, the zero of the vernier is set to the division 30 inches, the division 10 upon the vernier corresponding with that of 28 inches 9-10ths on the scale. Hence, the vernier division 1 is one-hundredth of an inch below the scale division 29 inches 9-10ths; division 2 on the vernier is two-hundredths below 29 inches 8-10ths, and so on. Supposing the vernier were raised any number of hundredths, as two-hundredths of an inch, the division 2 would coincide with 29 inches 8-10ths. To read off the hundredths of an inch the vernier zero advances beyond any tenth on the scale; the division that coincides nearest with any on the scale, must be taken for the hundredth required.—*Chromatic vernier*, an instrument invented by Sir David Brewster, for the purpose of measuring by comparison the very minute variations of tints.

The different vertebrae which compose the spine, are divided into *true* and *false*, the former constituting the upper and longest portion, and the latter the lower portion of the spinal column, consisting of the *os sacrum* and *coccyx*. The true vertebrae are further divided into *cervical*, *dorsal*, and *lumbar*; or those of the neck, back, and loins. In man there are seven cervical vertebrae, twelve dorsal, and five lumbar. There is in every vertebra, between its body and apophyses, a foramen or hole, large enough to admit a finger. These foramina correspond with each other through all the vertebrae, and form a long bony conduit for the lodgment of the spinal marrow. The vertebrae are united together by means of a substance compressible like cork, which forms a kind of cushion between them, and admits of a certain degree of motion, small between individual bones, but considerable as respects the whole spinal column. The vertebrae and their pro-

jections or processes, also afford attachments for a number of muscles and ligaments, and also passages for blood vessels, and for the nerves that pass out of the spine. In different animals the number of vertebrae varies exceedingly.

**VE'TO**, *n.* [L. *veto*, I forbid.] A forbidding; prohibition; or the right of forbidding; applied to the right of a king or other chief magistrate or officer to withhold his assent to the enactment of a law, or the passing of a decree. Thus the king of Great Britain has a *veto* upon every act of parliament; he sometimes prevents the passing of a law by his *veto*.—2. In *Scotland*, an act passed in 1835 by the General Assembly of the Church, known by the name of the *veto act*. By this act it was decreed that no one should be admitted a minister of any vacant church, if a majority of the male heads of families, in full communion with the church, should dissent from his call. The *veto act*, however, by a decision of the Court of Session in 1838, was declared to be illegal, and *ultra vires* of the General Assembly. This decision was confirmed by the House of Lords in 1839, but the Church of Scotland, considering the admission of ministers a matter of spiritual jurisdiction, inherent in the church, according to the word of God, her original constitution, as well as ratified by the law and constitution of the country, resolved to adhere to the principles of spiritual independence, and non-intrusion; though she always professed her readiness to give effect to them in any form that would in reality secure them. The civil courts and finally the legislature, having resolved to grant the church no redress of the grievances inflicted by the violation of those principles, it ultimately led to the disruption of 1843. After this event the remnant members constituting the Assembly of the Established church rescinded the *veto law*.—3. In a *looser sense*, any authoritative prohibition.

**VIBRA'TION**, *n.* [Fr. from *L. vibro*.]

1. The act of brandishing; the act of moving or state of being moved one way and the other in quick succession.—2 In *mech.*, a regular reciprocal motion of a body suspended; a motion consisting of continual reciprocations or returns; as, of the pendulum of a time-keeper. This is more frequently called *oscillation*. The number of *vibrations* in a given time depends on the length of the vibrating body. The number of *vibrations* performed by two pendulums of different lengths in a given time is inversely as the square roots of their lengths, and the times of their *vibrations* are directly as the square roots of their lengths. The *vibrations* of a pendulum are somewhat slower at or near the equator, than in remote latitudes, in consequence of the diminution of the force of gravity at or near the equator. The *vibrations* of the same pendulum, or of different pendulums of the same length, in the same place, in very small arcs of circles, are always performed in the same time. [See *OSCILLATION*, *PENDULUM*.]—3. In *physics*, the tremulous motion produced in a body when struck, or when its particles are disturbed by any action or impulse; sound is produced by exciting vibrations in the bodies emitting it. The term *vibration* is also applied to the alternate or reciprocating motion which is produced among the particles of a fluid or ethereal medium when their equilibrium is disturbed by any impulse; by which means waves or undulations are caused; as, the *vibrations* produced in water when agitated; the *vibrations* produced in the air by sounding bodies; the *vibrations* produced in a supposed ethereal medium by luminous bodies or by heat; the *vibrations* of the nervous fluid, by which sensation has been supposed to be produced, by impressions of external objects propagated thus to the brain.—4. In *music*, the regular reciprocating motion of a chord or of a body, which, when suspended, or stretched between two fixed points, swings or shakes to and fro, and thus produces musical sounds, or tones. The number of *vibrations* performed by a musical string, in a given time, is directly as the length of the string; the number of *vibrations* are also proportional to the square roots of the forces by which the strings are stretched. The times of *vibrations* of different strings are as their lengths directly, and the square roots of the tending forces inversely. The number of vibrations will also depend on the thickness and density of the strings, being much less in thick and heavy strings, than in small and light ones. In wind instruments, the sounds are produced by the vibrations of a column of air, contained in a straight or crooked tube. [See *SOUND*, *TOPE*.]

There are several varieties, all hardy evergreen shrubs, and general favourites. *V. lantana*, the wayfaring tree, is a native of Europe and the west of Asia. The young shoots are used in Germany for basket-making; the wood is sometimes employed in turning and cabinet-making; the berries are used for making ink, and the bark of the root for making birdlime. *V. opulus*, the guelder rose, is native throughout Europe, and is especially frequent in Britain and Sweden. One who conquers in war; a vanquisher; one who defeats an enemy in battle. *Victor* differs from *conqueror*. We apply *conqueror* to one who subdues countries, kingdoms, or nations; as, Alexander was the *conqueror* of Asia or India, or of many nations, or of the world. In such phrases, we cannot substitute *victor*. But we use *victor*, when we speak of one who overcomes a particular enemy, or in a particular battle; as, Cæsar was *victor* at Pharsalia. The duke of Wellington was *victor* at Waterloo. *Victor* then is not followed by the possessive case; for we do not say, Alexander was the *victor* of Darius, though we say, he was *victor* at Arbela.

Conquest; the defeat of an enemy in battle, or of an antagonist in contest; a gaining of the superiority in war or combat. *Victory* supposes the power of an enemy or an antagonist to prove inferior to that of the victor. *Victory* however depends not always on superior skill or valour; it is often gained by the fault or mistake of the vanquished.

*Victory* may be honourable to the arms, but shameful to the counsels of a nation.

This word is now never used in the singular.] Food for human beings, prepared for eating; that which supports human life; provisions; meat; sustenance. We never apply this word to that on which beasts or birds feed, and we apply it chiefly to food for men when cooked or prepared for the table. We do not now give this name to flesh, corn, or flour, in a crude state; but we say, the *victuals* are well cooked or dressed, and in great abundance. We say, a man eats his *victuals* with a good relish. Such phrases as, to buy *victuals* for the army or navy, to lay in *victuals* for the winter, &c., are now obsolete. *Auchenia vicugna.*

breast and lower parts white. It is a native of South America, and frequents lofty slopes in the Andes of Chili, &c., where some scanty vegetation is to be found, but never ventures up to the naked rocky summits, for its soft tender feet are only suited for turfy ground. It lives in herds of 6 to 15 females, and one male, the leader and protector of the herd, who, standing at a short distance, while the females are feeding, gives timely warning of danger, by a sort of whistling sound and a quick movement of the foot.

The party wishing for the view applies to the court for a view, and where it is granted, six jurors are selected for the purpose, called *viewers*, who must be summoned by the sheriff to attend at the place in question, where the premises are pointed out to them by two persons named by the court, and technically called *shevers*. According to the French orthography, this word is formed from *vile*; but the orthography in other languages connects this word with *vill*, *village*, and this is probably the true origin.] 1. In *feudal law*, a villain or villen is one who holds lands by a base or servile tenure, or in *villanage*. Villains, who belonged principally to lords of manors, were of two sorts; *villains regardant*, that is, annexed to the manor or land, *adscriptitii glebæ*; or *villains in gross*, or at large, that is, annexed to the person of their lord, and transferable by deed from one owner to another. They could not leave their lord without his permission; but if they ran away, or were purloined from him, they might be claimed and recovered by action like beasts, or other chattels. They held indeed small portions of land to sustain themselves and families, but it was at the mere will of the lord, who might dispossess them whenever he pleased, and their tenure bound them to what were termed *villain* or ignoble services. A villain could acquire no property either in land or goods; if he purchased either the lord might seize them to his own use.—2. A vile wicked person; a man extremely depraved, and capable or guilty of great crimes. We call by the name of *villain*, the thief, the robber, the burglar, the murderer, the incendiary, the ravisher, the seducer, the cheat, the swindler, &c.

**VIL'LEIN**, *n.* See **VILLAIN**, No. 1.

**VIL'LENAGE**, *n.* [from *villain*.] A tenure of lands and tenements by base services. This tenure was neither strictly feudal, Norman, or Saxon, but mixed and compounded of them all. It was originally founded on the servile state of the occupiers of the soil, who were allowed to hold portions of land at the will of their lord, on condition of performing base and menial services. Where the service was base in its nature, and undefined as to time and amount, the tenure received the name of *pure villenage*, but where the service, although of a base nature, was certain and defined, it was called *privileged villenage*, and sometimes *villain suage*. It frequently happened that lands held in villenage descended in uninterrupted succession from father to son, until at length the occupiers or villains became entitled, by prescription or custom, to hold their lands against the lord, so long as they performed the required services. And although the villains themselves acquired freedom, or their land came into the possession of freemen, the villain services were still the condition of the tenure, according to the custom of the manor. These customs were preserved and evidenced by the rolls of the several courts-baron, in which they were entered, or kept on foot by the constant immemorial usage of the several manors in which the lands lay. And as such tenants had nothing to shew for their estates but the entries into those rolls, or copies of them authenticated by the steward, they at last came to be called *tenants by copy of court-roll*, and their tenure a *copyhold*.

It is now more usual, however, to enclose quantities that are to be connected together, within parentheses or brackets: thus,  $(a + b + c) \times x$  or  $\{a + b + c\} \times x$ ;  $(x^2 - y^2) \div (x + y)$ , or  $\{x^2 - y^2\} \div \{x + y\}$ .—3. ## VINTAGE

by the fermentation of various fruits, or of a solution of sugar mixed with yeast; in short, all liquids which are capable of the vinous fermentation may be made to produce vinegar. 120 parts of water, 12 of brandy, 8 of brown sugar, 1 of tartar, and  $\frac{1}{2}$  of sour dough, if left for some weeks in a warm place, yield a strong and pleasant vinegar. All the above vinegars yield by distillation a purer and somewhat weaker acetic acid, called *distilled vinegar*.—*Radical vinegar*, hydrated acetic acid, obtained by distilling 3 parts of dry powdered acetate of soda, with 9.7 of oil of vitriol, as pure and concentrated as possible. This vinegar, holding camphor and essential oils in solution, constitutes the *aromatic vinegar* of the shops.—*Wood vinegar*, pyroligneous acid,—*which see*. Common and distilled vinegars are used in pharmacy for preparing many remedies, and externally in medicine, in the form of lotions. The use of vinegar as a condiment is universal. It consists in the peculiar decomposition which the different species of sugar undergo in certain circumstances, and by which their elements combine to form new compounds, which, under similar conditions, are always the same. When a saccharine solution is placed in contact with substances in a state of decomposition or putrefaction, it is observed, after about 24 hours, if the temperature be kept between 40° and 86°, that the taste of the sugar has disappeared; pure carbonic acid is disengaged, and the liquid has acquired intoxicating qualities. It now contains alcohol, which may be separated by distillation. [See *FERMENTATION*.]

VI'OL, } *n.* [Fr. *virole*; It. and Sp. *viol*.] *viola*; Ir. *biol*.] An ancient musical instrument of the same form as the violin, and which may be considered as the parent of our modern instruments of the violin kind. The viol was a stringed instrument with frets, and played on by a bow. There were three sorts, treble, tenor, and base, each having six strings. The *treble viol* was somewhat larger than our violin, and the music for it was written in the treble clef. The *tenor viol* was about the same length and breadth as the modern tenor violin, but thicker in the body, and the music for it was in the soprano, or C clef. The dimensions of the *base viol* were much the same as those of the violoncello, and the music for it was written in the base clef.—*Viol di gamba*, or *leg-viol*, an old musical instrument with six strings, so called because it was held between the legs. Every kind that lives,  
Fomented by his *virtual* power, and warm'd.

Neither an actual nor *virtual* intention of the mind, but only that which may be gathered from the outward acts.

2. Being in essence or effect, not in fact; as, the *virtual* presence of a man in his agent or substitute.—*Virtual focus*, in *optics*, the point from which rays, which have been rendered divergent by reflection or refraction, appear to issue. [*See FOCUS*.]—*Virtual velocity*, in *mech.*, the velocity which a body in equilibrium would actually acquire, during the first instant of its motion, in case of the equilibrium being disturbed. The *principles of virtual velocities* may be thus enunciated: "If any system of bodies or material points, urged each by any forces whatever, be in equilibrium, and there be given to the system any small motion, by virtue of which, each point describes an infinitely small space, which space will represent the *virtual velocity* of the point; then the sum of the forces, multiplied each by the space which the point to which it is applied describes in the direction of that force, will be always equal to zero or nothing, regarding as positive the small spaces described in the direction of the forces, and as negative those described in the opposite direction." This great principle may be considered as the golden rule of mechanics. It is easily verified by experiment with respect to the six mechanical powers, but it applies immediately and most evidently to all

# VIRTUE

questions respecting equilibrium or statical problems, and it furnishes a very easy method of ascertaining the power of any machine, or the proportion between two forces which would balance one another. For according to this principle, the power multiplied by the space through which it moves in the vertical direction, must always be equal to the weight multiplied by the space through which it moves in the vertical direction.

**VIR'TUAL'ITY**, *n.* Efficacy.

**VIR'TUALLY**, *adv.* In efficacy or effect only; by means of some virtue or influence, or the instrumentality of something else. Thus the sun is *virtually* on earth by its light and heat. **VIR'TUE**, *n.* (*ver'tu*.) [*Fr. vertu*; *It. virtù*; *L. virtus*, from *vir*, or its root. *See WORTH*.] The radical sense is strength, from straining, stretching, extending. This is the primary sense of *L. vir*, a man.] 1. Strength; that substance or quality of physical bodies, by which they act and produce effects on other bodies. In this literal and proper sense, we speak of the *virtue* or *virtues* of plants in medicine, and the *virtues* of drugs. In decoctions the *virtues* of plants are extracted. By long standing in the open air, the *virtues* are lost.—2. Bravery; valour. This was the predominant signification of *virtus* among the Romans.

Trust to thy single *virtues*.  
[This sense is nearly or quite obsolete.] 3. Moral goodness; the practice of moral duties and the abstaining from vice, or a conformity of life and conversation to the moral law. In this sense, *virtue* may be, and in many instances must be, distinguished from religion. The practice of moral duties merely from motives of convenience, or from compulsion, or from regard to reputation, is *virtue* as distinct from religion. The practice of moral duties from sincere love to God and his laws, is *virtue* and religion. In this sense it is true,  
That *virtus* only makes our bias below.

This term was employed by Newton to signify a power implanted in all matter, by which it resists any change endeavoured to be made in its state; that is, by which it becomes difficult to alter its state either of rest or motion. A distinction is made between *vis inertia* and *inertia*, the former implying the resistance itself which is given by a body to any force endeavouring to make it change its state; and the latter merely the property by which the resistance is given.—*Vis motrix*, moving force.—*Vis mortua* and *vis viva*, terms used by Leibnitz and his followers; the former signifying the power of pressure in a body at rest; and the latter, the force or power of a body in motion, estimated by the distance to which the body goes.—2. It is also termed *vis conservatrix*.—*Vis mortua*, that property by which a muscle, after the death of the animal, or immediately after having been cut out of the living body, contracts.—*Vis nervosa*, the power of the muscles, by which they act, when excited by the nerves, as opposed to the *vis insita*.—*Vis plastica*, the formative power or energy which spontaneously operates in animals.—*Vis vitalis*, the vital power or energy; the natural power of the animal machine in preserving life.—3. The modern practice of episcopal visitations, however, is to summon the clergy from several parts to one convenient place, while the visitation of the ancient parochial institutions has by degrees devolved on the archdeacons. The duty of the archdeacons now is to visit their respective archdeaconries from time to time, to see that the churches are kept in repair, and that every thing is done conformably to the canons, and consistently with the decent and orderly performance of public worship; and to receive presentations from the church wardens of matters of public scandal. 5. The peduncles are racemose,

# VITELLARY

thyrsoid, corymbose, cymose, or umbellate, opposite the leaves, and are sometimes changed into tendrils. The most characteristic property of this order is acidity, which is most fully developed in the grape-vine. The acid of the grape is chiefly the tartaric; malic acid is, however, found in them. The dried fruit and wine are the really important products of the grape, and are yielded by no other of the order, if we except the Fox-grapes of North America. All the species are climbing plants, and some of them are supplied with hooked tendrils, by which they lay hold of the branches of trees, and thus elevate themselves above their summits.

The species, which are found chiefly in Asia and America, are climbing shrubs, with simple lobed, cut, or toothed, rarely compound leaves, and thyrsoid racemes of small greenish yellow flowers. The best known, and by far the most important species, is

Vine (*Vitis vinifera*).

the *V. vinifera*, the common vine, or grape-vine, of which there is a multi-

## VITRIFICATION

tude of varieties. The cultivation of the vine extends from near 55° north latitude to the equator, but in south latitudes it only extends to about 40°. It is rarely grown at a greater altitude than 3000 feet. In favourable seasons the vine ripens in the open air in England, and in the 11th and 12th centuries, considerable quantities of inferior wine were made from native grapes. Vineyards are now, however, unknown in this country; but the grapes raised in hot houses are excellent. The vine grows in every sort of soil; but that which is light and gravelly seems best suited for the production of fine wines. It succeeds extremely well in volcanic countries. The vine is a long-lived plant; indeed, in warm climates, the period of its existence is not known. It is propagated from seeds, layers, cuttings, grafting, and by inoculation. Several species of vine are indigenous in North America, as the *Vitis labrusca*, the wild-vine or fox-grape; *V. cordifolia*, heart-leaved vine or chicken grape; *V. riparia*, river-side or sweet-scented vine. [See WINE.]

Resembling glass; as, the *vitreous* humour of the eye, so called from its resembling melted glass. This humour occupies more than three-fourths of the interior of the eye, and is seated behind the crystalline lens. The rays of light which enter the eye undergo two refractions in passing through the aqueous humour and crystalline lens. On entering the vitreous humour they undergo a third refraction, thus acquiring their final degree of convergence, so that they form an image at a focus on the retina or very near it. \* *Vitreous electricity*, that produced by rubbing glass. [See ELECTRICITY.]

## VITRIOLIZING

**VITRIFIED**, *pp.* Converted into glass.

—*Vitrified forts*, a name given to certain remarkable enclosures of stone existing in various parts of Scotland, especially in Inverness-shire. They are constructed of stones piled rudely upon one another, and firmly cemented together by some material which has been vitrified by fire, the stones themselves being also partially vitrified. They generally surround the top of some steep conical hill, and are supposed to have been intended for defensive military posts. Various hypotheses have been framed to account for the vitrified appearance of these structures, but it seems most reasonable to suppose that the material of which they are built was selected with a view to its capability of being vitrified; for the stones that have been most commonly used are granite or moorstone, limestone, sandstone, and pudding-stone, all of which are more or less easily fusible by fire, and the process of vitrification may have been rendered easy by the quantities of wood which in early times covered the Highlands.

**VITRIFORM**, *a.* [L. *vitrum*, glass, and *form*.] Having the form or resemblance of glass.

**VITRIOLATE**, *v. t.* To convert into a vitriol; as iron pyrites by the absorption of oxygen, which reduces the iron to an oxide, and the sulphur to sulphuric acid. Thus the sulphuret of iron when *vitriolated*, becomes sulphate of iron or green vitriol.

The sense of the verb is to throw, to drive out sound; and *voice* is that which is driven out.] 1. An audible sound or noise produced in the throat and mouth of an animal by peculiar organs. Voices are either *articulate* or *inarticulate*. Articulate voices are those of which several conspire together to form some assemblage or little system of sounds; such are the voices expressing the letters of an alphabet, numbers of which joined together form words. Inarticulate voices are such as are not organized or assembled into words; as, the barking of dogs, the braying of asses, the hissing of serpents, the singing of birds, &c. We say, the *voice* of a man is loud or clear; the *voice* of a woman is soft or musical; the *voice* of a dog is loud or harsh; the *voice* of a bird is sweet or melodious. The *voice* of human beings is articulate; that of beasts, inarticulate. The *voices* of men are different, and when uttered together, are often dissonant. Mammals, birds, and reptiles are the only animals which possess a voice. In mammals, the air driven by the muscles of expiration from the lungs through the trachea, strikes against the two vibratile vocal chords, which bound the sides of the glottis, and thus a voice is produced varying in different animals according to the structure of the organs, and the power which the animal possesses over them. In man, the superior organization and mobility of the tongue and lips, enable him to modify his vocal sounds so as to render them articulate, and adapted to express his ideas. The infinite varieties of sounds heard in the human voice, are all embraced under the general terms, *pitch*, *loudness*, *quality*, and *duration*. A good musical voice depends chiefly upon the soundness and power of the organs of utterance and of hearing, and the musical disposition, and is distinguished by clearness of intonation, ease, strength, duration, equality, harmoniousness and fullness of the sounds. —2. Any sound made by the breath; as, the trumpet's *voice*. —3. A vote; suffrage; opinion or choice expressed. Originally *voice* was the oral utterance of choice, but it now signifies any vote, however given. Some laws ordain, and some attend the choice

Thus substances which affect the smell with pungent or fragrant odours, as musk, hartshorn, and essential oils, are called *volatile* substances, because they waste away on exposure to the atmosphere. Alcohol and ether are called *volatile* liquids for a similar reason, and because they easily pass into the state of vapour on the application of heat. On the contrary, gold is a *fixed* substance, because it does not suffer waste, even when exposed to the heat of a furnace; and oils are called *fixed*, when they do not evaporate on simple exposure to the atmosphere. [See *OIL*.]—4. Lively; gay; full of spirit; airy; hence, fickle; apt to change; as, a *volatile* temper.

Produced by a volcano; as, *volcanic* tufa.—*Volcanic products* are numerous and diversified, but lava, scoria, enamel, and glass, comprise by far the most important and interesting of them. The substances thrown out during volcanic eruptions, whether stony, liquid, or gaseous, disclose more or less completely the nature and condition of the interior masses of the globe. In the lava, or melted rock, the most important ingredients are felspar, augite, and oxide of iron, the mass being modified by various additional minerals and me-

tallic substances. The same substances compose the ashes of scoria. The liquid products of volcanoes, besides abundance of water, contain sometimes sulphuric and muriatic acids. Sublimations of common salt, and muriate of ammonia, are also found among these products. Among the gaseous products, chlorine, azote, sulphuretted hydrogen, sulphurous acid, and carbonic acid are the most common.—*Volcanic rocks*, rocks which have been formed by volcanic agency, as *trachyte*, *pumice*, *obsidian*, *augitic*, or *felspathic rocks*, &c.—*Volcanic bombs*, the name given to detached masses of melted lava, sometimes thrown out by volcanoes, which masses, as they fall, assume rounded forms, like bomb-shells, and are often elongated into a pear shape.—*Volcanic foci*, the subterranean centres of action in volcanoes, where the heat is supposed to be in the highest degree of energy.—3. **VOL'CANO**, *n.* [It. from *Vulcan*.] 1.

In *geol.*, an opening in the surface of the earth or frequently in a mountain, from which smoke, flames, stones, lava, or other substances are ejected. Such are seen in Etna and Vesuvius in Sicily and Italy, and Hecla in Iceland. It is vulgarly called a *burning mountain*, a name quite inapplicable, as many volcanoes are not in mountains, and some are submarine, ejecting their contents from under the sea. The eruptions from volcanoes are in general only temporary, a cessation, sometimes extending to centuries, intervening between the explosions; although, in other cases, a slow action is constantly going on with periods of increased energy, at intervals of months or years. *Volcanoes* are called *active*, when they continue to eject melted matter, mud, or vapours at intervals; and *extinct*, when they have ceased to emit such matters within the records of history. According to Jameson, about 193 active volcanoes have been observed; of which 13 belong to Europe and its islands, 66 to Asia and its islands, 8 to the islands of Africa, and 106 to America and its islands. Volcanoes usually form series of immense extent, frequently running in right lines although widely separated from each other. Volcanic eruptions are preceded by earthquakes, and earthquakes and volcanoes may be considered as different effects produced by the agency of internal heat, arising from chemical processes going on in the bowels of the earth.—2. The mountain that ejects fire, smoke, &c.

[See *GALVANIC, GALVANISM*.]—*Voltaic pile*, a column formed by successive pairs of

## VOLTI SUBITO

plates of two dissimilar metals, as zinc and copper, alternating with moistened flannel or pasteboard, in regular order of succession. **VOL'TAISM**, *n.* [from *Volta*, an Italian.] That branch of electrical science which has its source in the chemical action between metals and different liquids. **VOLTA'METER**, *n.* [*Volta*, and *Gr.* *metron*, measure.] An instrument contrived by Faraday, for measuring the amount of voltaic electricity passing in a current through it, by means of the quantity of water decomposed in a given time. In principle, it consists of a graduated tube, *c*, closed at one end, and inserted through a wooden cap into a jar, *d*, through the bottom of which the platina electrodes, *f*, connected with the two poles of the battery, *a* and *b*, are introduced.

Volta meter.

To determine the amount of any voltaic current passing through it, the tube, *c*, is taken out and filled with dilute sulphuric acid and water, then turned down into the solution in the jar, *d*, care being taken that in so doing no air is admitted into the top, and that the two platina electrodes are introduced under the mouth of the tube. The number of cubic inches of the mixed gases evolved by the current over a given time, may be read off on the scale by the depression of the fluid in the tube. This instrument is also frequently used to exhibit the analysis of water, the two gases, oxygen and hydrogen, being evolved, one at the positive and the other at the negative electrode. For this purpose the instrument is then furnished with two separate tubes, one over each electrode, to collect the respective gases. In the use of these instruments, all contact of the electrodes with each other must be carefully avoided.

**VOL'TI**, *n.* In music, a direction to turn over the leaf.

Of such volumes, Ptolemy's library in Alexandria is said to have contained 700,000.—2. A roll or turn; as much as is included in a roll or coil; as, the *volume* of a serpent.—3. Dimensions; compass; space occupied; bulk, size, or solid content; as, the *volume* of an elephant's body; the *volume* of a sphere; the *volume* of a cylinder; a *volume* of gas. In *chem.*, the size or bulk of an atom of any gaseous body is termed its *atomic volume*. It is not meant, however, that we can ascertain the absolute volume of the atoms, but the relative or comparative volume of the atoms or particles of two or more gases. It is generally admitted that equal volumes or bulks of different elementary gases contain different numbers of atoms, and hence the atoms must be of different sizes: Thus, the atoms of oxygen gas are  $\frac{1}{2}$  the size, and those of sulphur  $\frac{1}{8}$  the size of the atoms of hydrogen, nitrogen, chlorine, &c. To obtain the relative atomic volume of any gas, the atomic weight is divided by the specific gravity. Thus, the atomic weight of oxygen = 8, divided by its specific gravity 16, (that of hydrogen being 1,) gives the quotient  $\frac{1}{2}$  for the atomic volume of oxygen. When two gaseous bodies combine together, it is always in such proportions by volume, that one volume of the one gas combines with one, two, or more volumes of the other, and thus the composition of gaseous bodies may be expressed by volume as well as by

## VOLUNTARY

The Scriptures or sacred writings, bound in a single volume, are called the Bible.

## VOLVARIA

**VOL'UTA**, *n.* [Lat. a wreath.] A genus of testaceous gastropodous molluscs, including those which have a univalve spiral shell, with an aperture destitute of a beak, and somewhat obtuse, and a columella twisted or plaited, generally without lips or perforation. The species are principally found in tropical seas, and from the numbers and carnivorous habits of these animals, they serve as powerful agents in keeping other mollusca and conchifera within due limits. Their shells are prized by collectors above most others for their beauty and rarity. The Linnæan genus *voluta*, comprehended numerous species, but later naturalists have distributed them into the following subgenera: *oliva*, *volvaria*, *voluta* proper, *marginella*, *mitra*, and *cancellaria*.

A whirlpool; a whirling or circular motion of water, forming a kind of cavity in the centre of the circle, and in some instances, drawing in water or absorbing other things.—2. A whirling of the air; a whirlwind.

—3. In the Cartesian system, the circular motion originally impressed on the particles of matter, carrying them around their own axes, and around a common centre. Descartes supposed that God created matter of an indefinite extension, and hence concluded that there is no vacuum, but that the universe is absolutely full. He further supposed that God, when he created matter, separated it into small square portions or masses full of angles; that he impressed two motions on this matter; the one by which each part revolved about its own centre or axis; and another, by which an assemblage or system of such parts, turned round a common centre. Hence arose as many different vortices, or eddies, as there were different masses of matter, thus moving about common centres. By means of these vortices, Descartes attempted to account for the formation of the universe, but his system has long since been exploded.

**VORTICAL**, *a.* Whirling; turning; as, a vortical motion.

**VORTICILL**, *n.* [L. *vortex*.] A VORTICILLARIA, *n.* genus of wheel-animalcules, having a fixed stem, and having vibratile organs at their anterior extremity, which are constantly in rapid motion, and attract particles of food. **VOW**, *n.* [Fr. *vœu*; It. *voto*; L. *votum*, from *voveo*, to vow; probably a contracted word] 1. A solemn promise or oath made to God, or by a pagan to his deity. The Roman generals, when they went to war, sometimes made a *vow* that they would build a temple to some favourite deity, if he would give them victory. A *vow* is a promise of something to be given or done hereafter. A person is constituted a religious by taking three *vows*, of chastity, of poverty, and of obedience. Among the Israelites, the *vows* of children were not binding, unless ratified by the express or tacit consent of their father; Num. xxx. Among the *Romans*, *vows* signified sacrifices, offerings, presents, and prayers made for the Cæsars and emperors, particularly for their prosperity, and the continuance of their empire.—2. A solemn promise; as, the *vows* of unchangeable love and fidelity. In a moral and religious sense, *vows* are promises to God, as they appeal to God to witness their sincerity, and the violation of them is a most heinous offence.

**VOW**, *v. i.* [Fr. *vouer*; L. *voveo*.] 1. To give, consecrate, or dedicate to God by a solemn promise. When Jacob went to Mesopotamia, he *vowed* to God a tenth of his substance, and his own future devotion to his service; Gen. xxviii.

The letter or character which represents a simple sound, and which can be pronounced by itself. Vowels are thus distinguished from consonants, which require to be sounded with the aid of a vowel. The English vowels are six in number, viz., *a, e, i, o, u, y*.

**VUL'CANIST**, *n.* One who supports the *Vulcanian* or *Plutonian* theory, which ascribes the changes on the earth's surface to the agency of fire, and maintains that all rocks are of igneous production. The *Vulcanists* maintain that the earth was at first in a state of igneous fusion, that it gradually cooled, and became covered only at a subsequent period. They maintain that the land was raised up by a subterranean force, the irregularities which diversify its surface being the effects of volcanic eruptions; and that the transported soils have been formed by the disintegrations of the higher grounds. The *Vulcanists* were opposed to the *Neptun-*

ists, who maintained that all geological formations have been precipitated from water, or from a chaotic fluid. The *Vulcanian* theory has been expanded and illustrated by Lyell, and some other geologists of the present day.

**VULCANIZA'TION**, *n.* A new method of treating Indian rubber, by which its valuable properties are greatly increased, and some new ones bestowed upon it. It is as follows:—The Indian rubber is immersed in a bath of fused sulphur, heated to a proper temperature, until, by absorbing a portion of the sulphur, it assumes a carbonized appearance, and eventually acquires the consistence of horn. The same state can, however, be produced by either kneading the India rubber with sulphur, and then exposing it to a temperature of 190°, or by dissolving it in any of the common solvents, as turpentine, holding sulphur in solution or suspension. The compound thus formed is properly a sulphuret of caoutchouc, and possesses the following properties. It remains elastic at all temperatures; it cannot be dissolved by the ordinary solvents, neither is it affected by heat within a considerable range of temperature; finally, it acquires extraordinary powers of resisting compression, with a great increase of strength and elasticity. Vulcanized India rubber has been employed with great success as a substitute for the spiral steel springs used for the *buffers* of railway carriages, to moderate the effects of concussion. It is also used in railways, and is laid between the rail and the sleeper, and thus prevents the rails from indicating any traces of pressure. It forms in engines a most valuable material for washers, and it is formed into a tubing of great strength and flexibility, well adapted for fire-hose, and for any apparatus required in conveying steam, water, or gas. It also forms elastic bands, trouser-straps, surgical bandages, and a number of other articles.

**VUL'CANIZED INDIAN RUBBER**. Indian rubber or caoutchouc combined with sulphur. [See *VULCANIZATION*.]

The strength of their talons does not correspond with their size, and they make more use of their beak than of their claws. In general, the birds belonging to this genus are of a cowardly nature, living chiefly on dead carcases and offal. Their geographical distribution is confined chiefly to warm countries, where they act as scavengers to purify the earth from the putrid carcases with which it would otherwise be encumbered. ## W.

**W** IS the twenty-third letter of the English Alphabet. It takes its written form and its name from the union of two Vs, this being the form of the Roman capital letter which we call U. The name, *double u*, being given to it from its form or composition, and not from its sound, ought not to be retained. Every letter should be

named from its sound, especially the vowels. W is properly a vowel, a simple sound, formed by opening the mouth with a close circular configuration of the lips. It is precisely the *ou* of the French, and the *u* of the Spaniards, Italians, and Germans. With the other vowels it forms diphthongs, which are of easy pronunciation; as in

*well, want, will, dwell*; pronounced *ouell, ouant, ouill, douell*. In English, it is always followed by another vowel, except when followed by *h*, as in *when*; but this case is an exception only in writing, and not in pronunciation, for *h* precedes *w* in utterance; *when* being pronounced *hoorn*. In Welsh, *w*, which is sounded as in English, is used with-

## WADDING

out another vowel, as in *fiel*, a fool; *dien*, dun; *dub*, mortar; *girn*, a gun, and a gown. It is not improbable that the Romans pronounced *v* as we do *w*, for their *volvo* is our *wallow*; and *volo*, *velle*, is the English *will*, *G. wollen*. But this is uncertain. The German *v* has the sound of the English *f*, and *w* that of the English *v*. *W*, at the end of words, is often silent after *a* and *o*, as in *live*, *saw*, *low*, *sow*. In many words of this kind, *w* represents the Saxon *g*; in other cases it helps to form a diphthong, as in *now*, *row*, *new*, *strew*. As an abbreviation, *W* stands for *west*: *W.N.W.*, for *west-north-west*; *W.S.W.*, for *west-south-west*, &c.

**WAB'BLE**, *v. i.* [*W. greibian*, to wander, to move in a circular form.] To move from one side to the other; to vacillate; as a turning or whirling body. The lender or creditor is called the *wadsetter*, and the borrower the *reverser*. This was the earliest method of granting security on land in Scotland, and though still legal, it is now seldom, if ever, practised. Wadsets are divided into two sorts, *proper* and *improper*. When the wadsetter enters on possession, and takes, in place of interest, the yearly fruits, with the risk of the seasons, it is a proper wadset. When he agrees to accept of a fixed yearly sum as interest, and accounts to the reverser for the rents, the wadset is improper.

**WAGE**, *v. t.* [*G. wagen*; *D. waagen*; *Sw. vagn*, to venture, to dare, to wage; *Fr. gager*, for *guager*, to lay or bet; from the root of *wag*. The sense is to throw, to lay or throw down, as a glove or gauntlet.] 1.† To lay; to bet; to throw down, as a pledge; to stake; to put at hazard on the event of a contest.—2.† To venture; to hazard.

3. To make; to begin; to engage in, as by a previous pledge or determination; to carry on; that is, to go forward or advance to attack, as in invasion or aggression; used in the phrase, to *wage war*. He *waged war* with all his enemies.

Thy works for wealth.†

**WAGE**,† *n.* Gage; pledge; a stake.—2.† Hire; pay for service. The plural, *wages*, is now only used.

**WAGED**, *pp.* Laid; deposited; as a pledge; made or begun, or carried on, as war.

**WAGER**, *n.* A bet; something deposited, laid, or hazarded on the event of a contest or some unsettled question; something staked by each of two parties in support of his own opinion concerning a future or an unknown event. The party whose opinion proves to be correct, receives what has been staked by both.

Besides these plates for horse races, the *wagers* may be as the persons please.

*Temple.*

If any atheist can stake his soul for a *wager* against such an inexhaustible disproportion...

*Bentley.*

2. Subject on which bets are laid.—In *Eng. law*, *wagers* are valid, and may be made subjects of action, unless such as are rendered expressly void by law, or have an illegal or immoral tendency. In *Scots law*, all *wagers* are regarded as *pacta illicita*, or unlawful contracts. Hence, no action is competent for the recovery of any sum gained by betting or wagering in any form.—3. In *law*, an offer to make oath of innocence or non-indebtedness; or the act of making oath, together with the oaths of eleven compurgators, to fortify the defendant's oath.

—*Wager of law* was formerly a mode of trial, whereby in an action of debt brought upon a simple contract between the parties, without any deed or record, the defendant might discharge himself by taking an oath that he owed not the plaintiff anything; but, he required to bring with him eleven

persons of his neighbours, called *compurgators*, who were to avow upon their oath that they believed in their consciences that he declared the truth. This mode of trial is no longer in use.—*Wager of battle* was when the tenant in a writ of right offered to prove his right by the body of his champion, and throwing down his glove as a gage or pledge, thus *waged* or stipulated battle with the champion of the demandant, who, by taking up the glove, accepted the challenge. The champions, armed with batons, entered the list, and taking each other by the hand, each swore to the justice of the cause of the party for whom he appeared; they then fought till the stars appeared, and if the champion of the tenant could defend himself till that time, his cause prevailed. The *wager of battle*, which had been long disused, was, in 1818, demanded by the nearest relative of a murdered girl, against one Abraham Thornton, her supposed seducer and slayer; this led to its formal abolition, the year after, by the act 59 Geo. 3. c. 46.—To *lay a wager*, to lay down a pledge or surety; to bet.

Such policies are by statute 19 Geo. 3. made null and void.

**WAGES**, *n.* plural in termination, but singular in signification. [*Fr. gage, gages.*] 1. Hire; reward; that which is paid or stipulated for services. In *ordinary lan.*, the term *wages* is usually restricted to the sums paid as rewards to artificers, to domestic servants, to labourers employed in manufactures, in agriculture, mines, and other manual occupations. We speak of servant's *wages*, a labourer's *wages*, or tradesmen's *wages*; but we never apply the word to the rewards given to men in office, which are called *fees* or *salary*. The money paid for military and naval services is termed *pay*, and the incomes of clergymen *stipends*.

Tell me, what shall thy *wages* be? Gen. xxix.

Be content with your *wages*; Luke iii. 2. In *political economy*, the price paid for labour; the return made or compensation paid to those employed to perform any kind of labour or service by their employers. At present most fast days are popularly called *wakes* in the rural districts of England; but the peculiar *wake* of country parishes was originally the day of the week on which the church had been dedicated; afterwards the day of the year. Every rural parish had its *wake* every year, and most of them had two *wakes*, one on the day of dedication, and another on the birthday of the saint to whom the church was dedicated. The festival

3. The watching of a dead body all night by the friends and neighbours of the deceased; a custom which prevails in Ireland, and was formerly prevalent in Scotland. It most probably originated in a superstitious notion, with respect to the danger of a dead body being carried off by some of the agents of the invisible world, or exposed to the ominous liberties of brute animals. Such *wakes* very early degenerated into scenes of festivity, extremely incongruous to the melancholy occasion.—

4. Act of waking. [Old song.]—*Wake of a ship*, the track it leaves in the water, formed by the meeting of the water, which rushes from each side to fill the space which the ship makes in passing through it. This track may be seen to a considerable distance behind the ship's stern, as smoother than the rest of the sea. Hence it is usually observed by the compass, to discover the angle of lee-way. A ship is said to be in the *wake* of another, when she follows her on the same track, or a line supposed to be formed on the continuation of her keel. Two distant objects observed at sea are said to be in the *wake* of each other, when the view of the farthest is intercepted by the nearest, so that the observer's eye and the two objects are all in the same straight line.

They were for several centuries the subjects of a most cruel persecution instituted by the Church of Rome. According to the common opinion, the *Waldenses* owe their origin and name to Peter Waldo or Waldus, circa A. D. 1170; but some of their own writers derive the appellation from *vallée* [Fr.], *vaud* [Swiss], hence, also, *vaudois*, or dwellers in the valleys.

**WÄLHÄLLÄ**, *n.* (väl'hällä.) [Ger.] In Scandinavian myth.,—see **VALHALLA**, which is thus spelt by English writers for the sake of the pronunciation.—2. A remarkable architectural monument, built on the north bank of the Danube, near Ratisbon, intended for a national pantheon, consecrated to all Germans who have established for themselves permanent historical celebrity as warriors, statesmen, philosophers, poets, or in science, or in art. It was commenced October 18, 1830, and finished October 18, 1842, and forms externally a magnificent Doric octastyle peripteral temple, with its principal front facing the river. In the interior it is decorated with the most sumptuous splendour, executed with great originality of design.

**WALK**, *v. i.* (wauk.) [Sax. *wenloun*, to roll or revolve; *wenlcere*, a fuller, whence the name *Walker*; D. *walken*, to work a hat; G. *walken*, to full, to felt hats; *walker*, a fuller, Sw. *walhare*;

## WALK

Dan. *valher*, to full or mill cloth; *valker*, a fuller; *valke*, a pad or stuffed roll; G. *wallen*, to stir, to be agitated, to rove, to travel, to wander. From the same root are Russ. *valyu*, G. *wälzen*, to roll, and *wälisch*, foreign, Celtic, Welsh, that is, wanderers. The primary sense is simply to move or press, but appropriately, to roll, to press by rolling, as in hatching, and this is the origin of *walker*, for the practice of felting hats must have preceded that of fulling cloth in mills. Heb. *וָלַחַח*, *valach*.]

tive of Persia. It is a large handsome tree with strong spreading branches. In France and Germany the wood is much used by turners, cabinet-makers, joiners, coach-makers, and musical-instrument makers; but one of the most important uses of walnut timber is the making of gun-stocks, for which it is considered preferable to any other timber. In this country, however, the walnut-tree is more cultivated for its fruit than its timber. Walnuts are used for the table in almost every stage of their growth. The cotyledons of the seed of the walnut contain an oil, which is used in large quantities, especially on the Continent, by artists and also for lamps. Almost all parts of the plant possess a bitter principle, which acts as a tonic and anthelmintic. There are several distinct varieties of the walnut-tree. struggle, urge, drive, or to turn, to twist.] 1. A contest between nations or states, carried on by force, either for defence, or for revenging insults and redressing wrongs, for the extension of commerce or acquisition of territory, or for obtaining and establishing the superiority and dominion of one over the other. These objects are accomplished by the slaughter or capture of troops, and the capture and destruction of ships, towns, and property.

Among rude nations, war is often waged and carried on for plunder. As war is the contest of nations or states, it always implies that such contest is authorized by the monarch or the sovereign power of the nation. When war is commenced by attacking a nation in peace, it is called an *offensive* war, and such attack is *aggressive*. When war is undertaken to repel invasion or the attacks of an enemy, it is called *defensive*, and a defensive war is considered as justifiable. When war arises between different portions or members of the same nation, or between the established government of a nation, and a portion of the people resisting it, it is called a *civil* war. Very few of the *wars* that have desolated nations and deluged the earth with blood, have been justifiable. Happy would it be for mankind, if the prevalence of Christian principles might ultimately extinguish the spirit of *war*, and if the ambition to be great might yield to the ambition of being good.

Preparation for war is sometimes the best security for peace. *Anon.*

In this country, as in most monarchical governments, the right of declaring war belongs to the sovereign; but formal declarations of war are in modern times out of use, and war is now usually announced by the publication of what is termed a manifesto, the last preliminary step, short of actual hostilities, being the permission of reprisals.—*Council of war*, an assembly of great officers, called by a general or commander, to deliberate with him on enterprises and attempts to be made. The term is sometimes applied also to an assembly of officers sitting in judgment on delinquent soldiers, deserters, coward officers, &c.—*Honours of war*, distinctions granted to a vanquished enemy, as of marching out from a camp or intrenchments with all the insignia of military etiquette. **WARP'ING**, *n.* Act of him who warps, or that which warps.—2. In *agriculture*, a mode of fertilizing lands by producing a deposition of mud on their surface. This may be practised on the borders of large rivers and estuaries, into which the tides flow, or where floods are frequent; provided, however, that in either case the waters contain alluvial matter in a state of suspension. *Warping* is practised by various proprietors and farmers on the Humber, the Trent, the Ouse, and other rivers. The waters of these rivers, from passing through a great extent of alluvial country, are, after heavy rains, muddy to an excess; and they are in that state conducted over the surface of the adjoining land, and there suffered to deposit their mud, which is technically called *warp*, to the depth of an inch or two, which adds greatly to the fertility of the soil. In order to accomplish the process of *warping*, banks of earth are raised along the course of the rivers, so high that floods or tides cannot pass over them. In these banks there are more or fewer openings, according to the extent of ground to be *warped*, and other circumstances; but in general, they have only two sluices; the one, called the *floodgate*, to admit, and the other, called the *clough*, to let off the water gently. The floodgate is opened at high water, and the water flows in by one or more channels, made for the purpose of conveying it over the land, and covers it to the depth of high water. The floodgate is then shut, and at low water, the clough is opened, and the water runs out slowly, leaving the sediment behind it.—3. In *arch*. [See **CASTING**.]

**WARP'ING**, *ppr.* Turning or twisting; causing to incline; perverting; moving with a warp; enriching by overflowing with tide water.

It is *general* or *special*. *General warrandice* is interpreted by the rules of *implied warrandice*. *Special warrandice* is either, 1st, *Simple*, viz., that the grantor shall do nothing inconsistent with the grant, which is that implied in donations; 2d, *From fact and deed*, that is, that the grantor neither has done, nor shall do, any contrary deed, which is that implied in transactions; or, 3d, *Absolute*, against all deadly, whereby the grantor is liable for every defect in the right which he has granted. *Real warrandice* is that by which certain lands, called *warrandice lands*, are made over eventually in security of the lands conveyed. This is from the root of *guard*, *warren*, and *wary*. The primary sense of the root is to stop or hold, or to repel, and thus guard by resisting danger; as we say, to *keep off*. Hence the sense of security. The Welsh sense of smooth, placid, is derivative, either from security, or from repressing. [See *GUARD* and *GARRISON*.] 1. It is generally given as a security by one who is, or is about to become, the debtor of another, and enables the creditor to obtain a judgment against his debtor at once, and all the advantages of a judgment creditor, without the risk, delay, and expense of an action.—*Search warrant*, a precept authorizing a person to enter houses, shops, &c., to search for a criminal, or for stolen or smuggled goods. *Warrant officer*, an officer holding a warrant from the navy board, such as the gunner, boatswain, and carpenter of a ship. *Press warrant*, a warrant issued by the admiralty on cases of emergency, authorizing the captain or lieutenant of the impress service at any sea port, to impress such seamen belonging to the merchant service as may be found skulking about or unemployed.

**WAR/RANTY**, *n.* In *law*, a promise or covenant by deed, made by the bargainer for himself and his heirs, to warrant or secure the bargainee and his heirs against all men in the enjoyment of an estate or other thing granted. Such warranty passes from the seller to the buyer, from the feoffor to the feoffee, and from the releaser to the releasee. Warranty is *real*, when annexed to lands and tenements granted in fee or for life, &c., and is in deed or in law; and *personal*, when it respects goods sold or their quality. The use of warranties in conveyances has long been superseded in practice by covenants for title, whereby, as the covenantor engages for his executors and administrators, his personal as well as his real assets are answerable for the performance of the covenant. In common recoveries, a fictitious person is called to warranty. In the sale of goods or personal property, the seller warrants the title; for warranty is express or implied. If a man sells goods which are not his own, or which he has no right to sell, the purchaser may have satisfaction for the injury. And if the seller expressly warrants the goods to be sound and not defective, and they prove to be otherwise, he must indemnify the purchaser, for the law implies a contract in the warranty, to make good any defect. But the warranty must be at the time of sale, and not afterward. In *Scots law*, warranties in insurance are absolute conditions, non-compliance with which voids the insurance. They are either express or implied.—2. Authority; justificatory mandate or precept.

If they disobey any precept, that is no excuse to us, nor gives us any *warranty* to disobey likewise. *Kettlewell.*

8. A period of the night, in which one person or one set of persons stand as sentinels; or the time from one relief of sentinels to another. This period, among the Israelites, seems to have been originally four hours, but was afterward three hours, and there were four watches during the night. Hence we read in scripture of the morning watch, and of the second, third, and fourth watch; the evening watch commencing at six o'clock, the second at nine, the third at twelve, and the fourth at three in the morning; Exod. xiv.; Matt. xiv.; Luke xii.—9. A well known portable machine, generally of a small size, and round flat shape, for measuring time. The moving power in a watch is a spiral spring, and the regulating power the balance wheel, having also a small

spiral spring connected with it, which performs the same office as gravity in the case of the pendulum. The most accurately constructed watches are called *chronometers*, and are used at sea for determining differences of longitude.—*Repeating watch*, or *repeater*, a watch which is supplied with mechanism, by putting which in action, the wearer is enabled, at any time, as during the night, to ascertain the time within certain limits. This is usually effected by compressing a spring which causes a hammer or hammers to strike on a bell or other substance, the hours, quarters, &c.—10. Among seamen, a certain number of the ship's crew who are on duty at a time. The crew of every vessel, while at sea, is usually divided into two watches; one called the *starboard watch*, which in the merchant service is the captain's watch; the other the *larboard watch* (or as it is now termed in the royal navy, the *port watch*).—11. The period of time occupied by each part of a ship's crew alternately, while on duty.

The period of time called a *watch* is four hours, the reckoning beginning at noon or midnight. Between 4 and 8 p.m., the time is divided into two short or *dog-watches*, in order to prevent the constant recurrence of the same portion of the crew keeping the watch during the same hours. Thus, the period from 12 to 4 p.m. is called the *afternoon watch*, from 4 to 6 the first *dog-watch*, from 6 to 8 the second *dog-watch*, from 8 to 12 the *first night watch*, from 12 to 4 a.m. the *middle watch*, from 4 to 8 the *morning watch*, and from 8 to 12 noon the *forenoon watch*. When this alternation of watches is kept up during the 24 hours, it is termed having *watch and watch*, in distinction from keeping all hands at work during one or more watches.—*Anchor watch*, a small watch composed of one or two men appointed to look after the ship while at anchor or in port.—*To set the watch*, to appoint the division of the crew to enter upon the duty of the watch.—*To relieve the watch*, to relieve those who have been upon duty by changing the watch.—*Watch and ward*, the ancient custom of watching by night, and warding or keeping the peace by day, in towns and cities; a duty imposed upon every inhabitant in turn.

**WATER**, *n.* (wau'ter.) [*Sax.* *water*, *wes*; *D.* *water*; *G.* *wasser*; *Goth.* *wato*; *Russ.* *voda*. This may be from the root of *wet*, *Gr.* *υδω*, *Sans.* *udum*. In *Ar.* *wadi* signifies a stream, or the channel where water flows in winter, but which is dry in summer; a thing common on the plains of Syria and Arabia.] 1. A fluid, the most abundant and most necessary for living beings of any in nature, except air. Water, when pure, is transparent, colourless, inodorous, tasteless; a powerful refractor of light, an imperfect conductor of heat and electricity; it is very slightly compressible, its absolute diminution for a pressure of one atmosphere being only about 51·3 millionths of its bulk. It assumes the solid form, that of ice or snow, at 32°, and all lower temperatures; and it takes the form of gas or vapour, that of steam, at 212°, and retains that form at all higher temperatures. It possesses the liquid form only at temperatures lying between 32° and 212°. The specific gravity of water is 1, being the unit to which the specific gravities of all solids and liquids are referred, as a convenient standard, on account of the facility with which it is obtained in a pure state; one cubic inch of water at 62°, and 30 inches, barometrical pressure, weighs 252·468 grains. It is 815 times heavier than atmospheric air. Water is at its greatest density at 40°, and in this respect it presents a singular exception to the general law of expansion by heat. If water at 40° be

## WATER

cooled, it expands as it cools till reduced to 32°, when it solidifies; and if water at 40° be heated, it expands as the temperature increases in accordance with the general law. This expansion of water by cold below 40° produces very important effects in the economy of nature; for if its density increased as it approached the freezing point, large masses of water would become masses of solid ice. In a chemical point of view, water exhibits in itself neither acid nor basic properties; but it combines with both acids and bases forming *hydrates*; it also combines with neutral salts. Water also enters, as a liquid, into a peculiar kind of combination with the greater number of all known substances. Of all liquids, water is the most powerful and general solvent, and on this important property its use depends.

Without water, not only the operations of the chemist, but the processes of animal and vegetable life would come to a stand. In consequence of the great solvent power of water, it is never found pure in nature. Even in rain-water, which is the purest, there are always traces of carbonic acid, ammonia, and sea-salt. Where the rain-water has filtered through rocks and soils, and reappears, as spring or river-water, it is always more or less charged with salts derived from the earth, such as sea-salt, gypsum and chalk. When the proportion of these is small the water is called *soft*, when larger it is called *hard water*. The former dissolves soap better, and is therefore preferred for washing; the latter is often pleasant to drink. The only way to obtain perfectly pure water is to distil it. Distilled water is preserved in clean well stopped bottles, and used in chemical operations. Water is reposit in the earth in inexhaustible quantities, where it is preserved fresh and cool, and from which it issues in springs, which form streams and rivers. But the great reservoirs of water on the globe are the ocean, seas and lakes, which cover more than three-fifths of its surface, and from which it is raised by evaporation, and uniting with the air in the state of vapour, is wafted over the earth, ready to be precipitated in the form of rain, snow or hail. The old chemists regarded water as a simple element; but it is now known to be a compound substance, consisting of hydrogen and oxygen, in the proportion of 2 volumes of the former gas to one volume of the latter; or by weight, it is composed of 1 equivalent of hydrogen, 1, + 1 equivalent of oxygen, 8 = 9 its equivalent; it is in fact a protoxide of hydrogen. — 2. The ocean; a sea; a lake; a river; any great collection of water; as, in the phrases, to go by *water*, to travel by *water*. — 3. Urine; the animal liquor secreted by the kidneys and discharged from the bladder. — 4. The colour or lustre of a diamond or pearl, sometimes perhaps of other precious stones; as, a diamond of the first *water*, that is, perfectly pure and transparent. Hence the figurative phrase, a man or a genius of the first *water*, that is, of the first excellence. — 5. *Water* is a name given to several liquid substances or humours in animal bodies; as, the *water* of the pericardium, of dropsy, &c. — *Water of crystallization*, the water which unites chemically with many salts during the

## WATER-BORNE

act of crystallizing. It forms an essential part of the crystal, but not of the salt, and is easily expelled by heat, when the crystals generally fall to powder. — *Mineral waters* are those waters which are so highly charged with foreign matters, as to have an unpleasant taste, or to acquire medicinal virtues. There are several kinds of mineral waters; those in which iron predominates are called *chalybeate waters*; where sulphur prevails, they are called *sulphurous waters*; *acidulous waters* are those which contain much free carbonic acid; and *saline waters* are such as contain neutral salts, generally sea-salt, and sulphate of magnesia or Epsom salt. Most natural waters contain more or less of these foreign substances, but the proportion is generally too minute to affect the senses. — *Strong waters*, brandy, liquors, &c. [This term, once much in use, is now obsolete.] — To *hold water*, to be sound or tight. [*Obsolete or vulgar.*]

**WATER**, *v. t.* (wau'ter.) To irrigate; to overflow with water, or to wet with water; as, to *water* land. Showers *water* the earth. — 2. **WATER-GILDING,** n. The gilding of  
metallic surfaces by covering them  
with a thin coating of amalgam of gold,  
and then volatilizing the mercury by  
heat. The gold is thus left adhering  
to the surface, upon which it is after-  
wards burnished. Brass and copper  
buttons are gilt in this way; but before  
the amalgam is applied the surface of  
brass or copper is usually prepared by  
cleaning and rubbing it over with a  
solution of nitrate of mercury, which  
causes the amalgam of gold, when  
subsequently applied, to adhere to the  
surface.

the vessel with a peculiar noise. It  
may be formed by corking a vessel of  
water while it is boiling. The vapour

**WATER-SPOUT, n.** [water and spout.] A remarkable meteorological phenomenon observed for the most part at sea, but sometimes over the land. Its general appearance at sea may be thus described:—Below a dense cloud the sea appears to be greatly agitated within a circular area from 100 to 120 yards in diameter, the waves tending rapidly to the centre of the agitated mass, where a vast body of water or aqueous vapour is formed: from hence there rises, with a spiral movement, towards the cloud, a column of a conical form resembling a trumpet. Vertically above this ascending column there is formed, in the cloud, but in an inverted position, a corresponding cone, whose apex gradually approaches that of the ascending column, and at length both are united, and the junction has been observed to be accompanied with a

## WATER-WAY

flash of lightning. The water-spout is said to be accompanied also, during its formation, with a rumbling-noise like thunder. The whole column, which after the junction of the two cones, extends from the sea to the clouds, assumes a magnificent appearance, being of a light colour near its axis, but dark along the sides. When acted on by the wind the column assumes a position oblique to the horizon, but in calm weather it maintains its vertical position, while at the same time it is carried along the surface of the sea. Sometimes the upper and lower parts move with different velocities, causing the parts to separate from each other, often with a loud report. The whole of the vapour is at length absorbed in the air, or it descends to the sea in a heavy shower of rain. When a water-spout occurs above land, there is consequently no ascending column of water to meet that which descends. Such water-spouts often burst, discharging immense torrents of rain, and causing great destruction. Water-spouts are supposed by some to be formed by whirlwinds of extreme intensity; while others ascribe their origin to electric agency.

[*See these terms*.] All water-wheels consist in common of a hollow cylinder or drum, revolving on a central axle or spindle, from which the power to be used is communicated, while their exterior surface is covered with vanes, float-boards, or cavities upon which the water is to act. Water may be made to act as a moving power against wheels by its weight, as in the overshot wheel; by its momentum, as in the undershot wheel; or by both combined, as in the breast wheel.

It comprehends the methods of procuring the supplies necessary for these purposes, by means of pumps, water, or steam-engines. It also comprehends the subsequent management of the water thus conducted, whether in order to make the proper distribution of it according to the demand, or to employ it for the purpose of navigation by lockage, or other contrivances.

**WAVE, n.** [*Sax. weg, way*, a wave, a way; both the same word, and both coinciding with the root of *wag, waggon, vacillate, weigh*, &c. The sense is, a going, a moving, appropriately a moving one way and the other; *G. wege*; *Sw. vag*; *Ir. buaice*.] 1. A moving swell or volume of water; usually, a swell raised and driven by wind. A pebble thrown into still water produces *waves*, which form concentric circles, receding from the point where the pebble fell. But *waves* are generally raised and driven by wind, and the word comprehends any moving swell on the surface of water, from the smallest ripple to the billows of a tempest.

The *wave* behind impels the *wave* before.

*Pope*.

A *wave*, as it is generally observed, is an elevated portion of water travelling successively along the general surface. When the surface of water is unequally pressed upon, in parts contiguous to each other, the columns most pressed upon are shortened, and sink beneath the natural level of the surface, while those that are least pressed on are lengthened, and rise above that level. As soon as the former columns have sunk to a certain depth, and the latter have risen to a certain height, their motions are reversed, and continue so till the columns that were at first most depressed have become most elevated, and those that were most elevated have become most depressed. In this manner a reciprocating motion is produced, and a series of ridges and hollows is formed, which are called *waves*. When a *wave* of the sea is seen to ad-

vance towards the shore, the water appears to be moving in the same direction; but this is not the case, the only necessary motion of the water being in the vertical direction, so that the water may be perfectly at rest while the *wave* is moving; except this vertical ascent or descent; or it may be moving in any direction coincident with or opposed to the direction in which the *wave* is moving, without at all affecting the motion of the *wave*. The action of the wind upon the surface of the water is the principal cause of the waves which exist, and the height of the *wave* depends in a great measure on the depth of the water in which it is produced. In a sheet of water only a few feet deep the waves will rarely have a height exceeding a few inches; while the waves of the ocean frequently acquire a magnitude sufficient to hide from each other's view two vessels of the largest size, when only a small distance apart. The waves of the sea are of two kinds, *natural* and *accidental*. The natural waves are those which are exactly proportioned in size to the strength of the wind which gives rise to them. The accidental waves are those occasioned by the wind's reacting upon itself by repercussion from hills and mountains, or high shores, and by the washing of the waves themselves against rocks and shoals. Several series of waves moving in different directions may co-exist without destroying each other. Thus it may happen that while a long swell, resulting from some distant storm, is advancing in one direction, a breeze will produce a series of waves moving in the direction of the wind; and a second breeze springing up in another direction will produce a new series, which will become mixed with the former without destroying it. A third gale may also produce a series of waves intersecting the other systems. All these phenomena may be illustrated by throwing several stones into a pool of standing water, when as many series of waves, intersecting each other, will appear upon the surface. The *breadth* of a *wave* is equal to the space between the most elevated points of two adjoining waves, or between the lowest points of two adjoining hollows. A *wave* is said to have passed through its breadth when its elevated part is arrived at the place where the elevated part of the next *wave* stood before; or, the situation of two contiguous waves being given, when one of these has arrived at the place of the other; and the time which is employed in this transition is called the time of a *wave's* motion or the time of an undulation. A *wave* passes through its breadth in the time that a pendulum of half its length (that is, half the length of the surface of the water between the most elevated part of the ridge and the lowest part of the hollow) will perform two of its least vibrations. The *velocity* of a *wave* is the rate at which the points of greatest elevation or depression seem to change their places. *Tidal wave*, the great wave which is raised on the surface of the sea by the attractions of the sun and moon, and which moves from east to west. [*See TIDE*.]—*Artificial waves*, those which are produced by artificial means, as when a stone is thrown into a pool of water. Artificial waves serve to illus-

WAX, *n.* [Sax. *wæx*, *wes*; G. *wasch*; Russ. *waksa*; L. *viscus*, *viscum*.] 1. A thick, viscid, tenacious substance, excreted by bees, from their bodies, and employed in the construction of their cells; usually called *bees' wax*. Its native colour is yellow, and it has a peculiar smell resembling honey, which is derived from the honey deposited in the cells. When bleached and freed from impurities, wax is white, brittle, and translucent in thin segments; it has neither taste nor smell; it has a specific gravity of from 0.960 to 0.966. It melts at 158° and softens at 86°, becoming so plastic that it may be moulded by the hand into any form. It is a mixture of two substances in very variable proportions; the one is called *cerine*, and the other *myricine*. Wax is extensively employed both in its original and bleached state; in the latter state it is used for candles, and in numerous cerates, ointments, and plasters. It is also used in forming figures or images, busts, &c., in the preparation of anatomical models, in the preparation of fruit, flowers, and many objects of natural history. In statuary it is used in making models for the metal cast. Wax exists also as a vegetable product, and may in this point of view be regarded as a concrete fixed oil. It may be obtained from the pollen of many flowers, and it forms a part of the green secula of many plants, particularly of the cabbage. It appears as a varnish upon the fruit, and the upper surface of the leaves of many trees, as in the wax-palm and wax-myrtle.—2. \*A thick tenacious substance excreted in the ear.—3. A substance found on the hinder legs of bees, derived from the pollen of flowers. This was long supposed to be the substance from which bees elaborated the wax for their cells, but this notion

The investigation of the various causes which determine the state of the atmosphere, and produce those changes which are incessantly taking place in its condition, forms the subjects of *meteorology* and *climate*. The state of the weather has in all ages and in every country, occupied a large share of the attention of naturalists, as well as of ordinary observers; but the subject is so complicated, and the circumstances to be taken into account so numerous, that no theory hitherto framed, can furnish rules for determining the order in which the changes of the weather succeed each other, or for predicting the state of the weather at a future time, with any degree of certainty.—2. Change of the state of the air.—3. Storm; tempest. [These last significations are not now in use, unless by a poetic license.]—*Stress of*

**WEAVING**, *ppr.* Forming cloth by intermixture of threads.

**WEAVING**, *n.* The act or art of arranging in a machine called a loom, yarn or thread of various materials, as flax, cotton, wool, silk, &c., so as to form cloth. Weaving is performed by the hand in what are called *hand-looms*, or by steam in what are called *power-looms*. Weaving, in the most general sense of the term, comprehends not only those textile fabrics which are prepared in the loom, but likewise net-work, lace-work, and hosiery. **WEDGE**, *n.* [Sax. *wæg*, *wæg*; Dan. *weg*; D. *wip*.] This word signifies a mass, a lump. 1. A mass of metal; as, a *wedge* of gold or silver; Josh. vii.

—2. A piece of wood or metal, thick at one end and sloping to a thin edge at the other, used in splitting wood, rocks, &c. The wedge is a body contained under two triangular and three rectangular surfaces; as in the figure,

where the triangles  $AHE$ ,  $ADF$ , are the ends, the rectangles  $ADEF$ ,  $BCFE$ , the sides, and the rectangle  $ABCD$ , the top. The wedge is one of the mechanical powers, and is used for splitting blocks of timber and stone; for producing great pressure, as in the oil-press; and for raising immense weights, as when a ship is raised by wedges driven under the keel, &c. If the power applied to the top were of the nature of a continued pressure, the wedge might be regarded as a double inclined plane, and the power would be to the resistance to be overcome, as the breadth of the back,  $BC$ , to the length of the side,  $DE$ , on the supposition that the resistance acts perpendicularly to

*the side.* But since the power is usually that of percussion with a hammer, every stroke of which causes a tremor in the wedge, which throws off for the instant the resistance on its sides, no certain theory can be laid down regarding it. To calculate the power, we require the additional elements of weight of the hammer, momentum of the blow, and the intervals between the blows; and, further, the amount of tremor in the wedge and its antagonism to the resistance on the sides. All that is known with certainty respecting the theory of the wedge is that its mechanical power is increased by diminishing the angle of penetration D F C. All cutting and penetrating instruments, as knives, swords, chisels, razors, axes, nails, pins, needles, &c., may be considered as wedges. The angle of the wedge in these cases is more or less acute, according to the purposes to which it is to be applied. The utility of the wedge, in many cases, depends on the great friction which arises between its surface and that of the substance which it divides; for in consequence of this friction it is retained in the position to which it is driven, and prevented from recolling between the successive blows.—3. Something in the form of a wedge. Sometimes bodies of troops are drawn up in the form of a *wedge*.

**WEDGE**, *v. t.* To cleave with a wedge; to rive. [*Little used.*].—2. To drive as a wedge is driven; to crowd or compress closely. We were *wedged* in by the crowd.—3. balance; *wegan*, to weigh, to bear, to carry, *L. veho*; *G. wägen*; *Dan. vejer*, to weigh; *Russ. vaga*, a balance; *Amharic, awaki*, weight. See *WAG*]

1. To examine by the balance; to ascertain the weight, that is, the force with which a thing tends to the centre of gravity; to determine by the balance the weights of bodies by shewing their relation to the weights of some other bodies which are known, or which are assumed as general standards of weight; as, to weigh sugar; to weigh gold.—2. To be equivalent to in weight; that is, according to the Saxon sense of the verb, to lift to an equipoise a weight on the other side of the fulcrum. Thus when a body balances a weight of twenty-eight pounds avoirdupois, it lifts or bears it, and is said to weigh so much. It weighs a quarter of a hundred weight.—3. To raise; to lift; as, to weigh anchor from the ground, or any other body; as, to weigh anchor; to weigh an old hulk.—*Under-weigh*. A vessel is said to be under-weigh, when she has weighed anchor or left her moorings. It is also written *under-way*.—4. To pay, allot, or take by weight.

**WEIGHING**, *n.* The act of ascertaining weight; the process by which the

## WEIGHT

measure of the force by which any body, or a given portion of any substance gravitates to the earth, is ascertained; the process of determining the quantity of matter; or the number of grains, ounces, pounds, hundredweights, &c., which any substance contains. This is effected by balances of various kinds. Accurate weighing is of great importance, since in general it affords one of the best practical means of ascertaining the quantity of matter in bodies, and thence the values of the greater part of the necessities of life. It is also of great importance in many philosophical experiments. Troy weight is used in philosophical experiments, and in delicate weighing, and the weight is usually reckoned in grains.—2. As much as is weighed at once; as, a weighing of beef.

**WEIGHING-CAGE**, *n.* A cage in which small living animals may be conveniently weighed; as pigs, sheep, calves, &c.

**WEIGHING-HOUSE**, *n.* A building furnished with a dock and other conveniences for weighing commodities and ascertaining the tonnage of boats to be used on a canal.

**WEIGHING-MACHINE**, *n.* Any contrivance by which the weight of an object may be ascertained; as the common balance, spring balance, steelyard, &c., but the term is generally applied to those contrivances which are employed for ascertaining the weight of heavy bodies; as the machine usually employed at the toll-gates on roads for the purpose of determining the weights of laden carriages; machines for weighing cattle; machines for weighing heavy goods, as large casks, bales, &c. Some of these are constructed on the principle of the lever or steelyard, others on that of a combination of levers, and others on that of the spring-balance. They are also called weigh-bridges.

**WEIGHT**, *n.* (wate.) [*Sax. wigt*; *D. wigt*; *G. gewicht*. See *WEIGH*.] 1. The quantity of a body, ascertained by the balance; that property of bodies in virtue of which they tend towards the earth's centre of gravity. In a strictly philosophical sense, weight is the measure of the force of gravity, and not gravity itself. Gravity may be considered as a force acting on each of the elementary particles of a body urging it downwards; whereas the weight of a body is the product of the gravity of a single particle, by the number of particles. The weights of two bodies are to one another as the quantities of matter in those bodies; and two bodies are of equal weight which counterpoise each other, when placed at the ends of equal arms of a self-poising lever. As weight is the measure of the force of gravity, it follows that the weight of a body must be increased or diminished according as the force of gravity is increased or diminished. Hence a body that weighs, for instance, one pound at the level of the sea, will, if carried to the top of a mountain, weigh less than a pound, the force of gravity being inversely as the square of the distance from the earth's centre. The diminution of weight, however, at the top of the mountain, could not be indicated by a common balance, because in this instrument, both the weight and its counterpoise are in every situation equally affected by gravity; but if a body that weighs a pound at the level

## WEIGHTINESS

of the sea, be weighed at the top of a mountain by means of an accurately constructed spring-balance, the diminution of weight which it sustains can be ascertained. It must also be remembered, when weight is to be very accurately taken, that every body is buoyed up to a certain extent by the air; and the weight of a body in air is less than it would be in a vacuum, by the weight of its own bulk of air. Now the air varies in weight in a manner depending upon the temperature, the quantity of moisture contained in it, and other causes. In measuring standards of weight, therefore, close attention must be paid to the state of the air at the time of weighing, and also to the substance weighed.—2. In commerce, the measure of the force by which any body, or a given portion of any substance gravitates to the earth. A mass of iron, lead, brass, or other metal, to be used for ascertaining the weight of other bodies; as, an ounce weight, a pound weight, a stone weight, &c. Three systems of weights are admitted as standards in this country: viz., Troy weight used for weighing gold, silver, and precious stones; apothecaries' weight, used for the combination of drugs; and avoirdupois weight, used for all other commodities estimated by weight.—Standard unit of weight, a body selected as a standard by comparison, with which the weights of other bodies may be determined, and all other weights used in commerce measured and adjusted. By the Act of Parliament, 1824, the standard brass weight of 1 pound troy, made in the year 1758, then in the custody of the clerk of the House of Commons, was declared to be the original and genuine standard measure of weight, from which all other weights were to be derived, computed and ascertained; and that  $\frac{1}{16}$  of the said pound should be reckoned an ounce,  $\frac{1}{16}$  of said ounce, a pennyweight, and  $\frac{1}{24}$  of said pennyweight a grain, so that 5760 such grains were to constitute a pound troy, also 7000 such grains were to be a pound avoirdupois. The standard pound, however, was destroyed by the burning of the houses of parliament in 1834, and since that time there has been no legal standard unit of weight.—3. In mech., the resistance to be overcome by a machine, whether in raising, sustaining, or moving any heavy body. This resistance is so named, because whatever it be, a weight of equivalent effect may be found. The force which is employed to sustain or overcome the weight or resistance, is called the power.—4. A ponderous mass; something heavy.

A man leaps better with weights in his hands *Baron.*

5. Pressure; burden: as, the weight of grief; weight of care; weight of business; weight of government.—6 Importance; power; influence; efficacy; consequence; moment; impressiveness; as, an argument of great weight; a consideration of vast weight. The dignity of a man's character adds weight to his words.

It was in general paid to the relatives of him who had been slain, or, in the case of a wound or other bodily harm, to the person who sustained the injury; but if the cause was brought before the community, the plaintiff only received part of the fine; the community, or the king, when there was one, received the other part.

In a *less strict* sense, west is the region of the hemisphere near the point where the sun sets when in the equator. Thus we say, a star sets in the *west*, a meteor appears in the *west*, a cloud rises in the *west*.—2. A country situated in a region toward the sun-setting with respect to another. Thus in the United States, the inhabitants of the Atlantic states speak of the inhabitants of Ohio, Kentucky, or Missouri, and call them people of the *west*; and formerly, the empire of Rome was called the empire of the *West*, in opposition to the empire of the *East*, the seat of which was Constantinople.

The great majority of those who attended this assembly were presbyterians. Those members of episcopalian principles refrained from attending, because the king had declared against the assembly. *Note*.—In words beginning with *wh*, the letter *h*, or aspirate, when both letters are pronounced, precedes the sound of *w*. Thus *what*, *when*, are pronounced *hwat*, *hwen*. So they were written by our ancestors, and so they ought to be written still, as they are by the Danes and Swedes.

They are characterized by having fin-like anterior extremities, the posterior extremities having their place supplied by a large horizontal caudal fin or tail, and the cervical bones so compressed as to leave the animal without any outward appearance of a neck. In this order are comprised the largest animal forms in existence. Some of the genera are phytophagous, or feed upon plants; others are zoophagous, or feed upon animals. Their abode is in the sea or the great rivers, and they resemble the fishes so closely in external appearance, that not only the vulgar, but even some of the earlier zoologists regarded them as belonging to that class. The Cetacea are divided by Cuvier into two great tribes or families, one of which he terms *Herbivorous cetacea*, including the genera *Manatus*, *Halicore*, and *Stellerus*; and the other, *Ordinary cetacea*, comprising the genera *Delphinus*, *Phocæna*, *Monodon*, *Physeter*, and *Balaena*. The Herbivorous Cetacea, however, are rather aquatic pachydermata. The

common or Greenland whale is the *Balaena mysticetus*, so valuable on

account of the oil and whalebone which it furnishes. It is principally found in the Arctic seas, but it is also found, in considerable numbers, in many other parts of the world. Its length is usually about 60 feet, and its greatest circumference from 30 to 40 feet. The razor-backed whale, or northern rorqual, is the *Balenoptera physalis*. It is about 100 feet long, and from 30 to 35 feet in circumference. The sperm whale is the *Physeter macrocephalus*, and is about 80 feet in

length, and from 30 to 35 feet in circumference. It is principally found in the Southern ocean, on the coasts of America, Japan, New Guinea, &c., and is much valued on account of the spermaceti and the fine oil which it yields.

**WHALEBONE**, *n.* [*whale* and *bone*.] A well-known elastic horny substance, which adheres in thin parallel plates to the upper jaw of the whale. These plates or laminae vary in size from 3 to 12 feet in length; the breadth of the largest at the thick end, where they are attached to the jaw, is about a foot, and the average thickness is from four to five tenths of an inch. All above six feet in length are called *size bone*. From its flexibility, strength, elasticity, and lightness, whalebone is employed for many purposes, as for ribs to umbrellas and parasols, for stiffening stays, for the frame-work of hats, &c.

There are two kinds of wharfs, viz., *legal wharfs* and *suffrance wharfs*. The former are certain wharfs in all sea ports, at which goods are required to be landed and shipped, by 1 Eliz. c. 11 (now repealed), and subsequent acts. Wharfs in docks and similar situations, are made legal by special acts of parliament; certain wharfs, as at Chepstow, Gloucester, &c., are deemed legal from immemorial usage. *Suffrance wharfs* are places where certain goods may be landed and shipped; as hemp, flax, coal, and other bulky goods, by special suffrance, granted by the crown for that purpose.

The Gothic *h* represents the Latin *c*, in *vicius*.] 1. That which.

Say *what* you will, is the same as say *that which* you will.—2. Which part. Consider *what* is due to nature, and *what* to art or labour.—3. *What* is the substitute for a sentence or clause of a sentence. "I tell thee *what*, corporal, I could tear her." Here *what* relates to the last clause, "I could tear her;" this is *what* I tell you.—4. *What* is used as an adjective, of both genders, often in specifying sorts or particulars. See *what* colours this silk exhibits. I know *what* qualities you desire in a friend; that is, I know the *qualities which* you desire.—5. *What* is much used in asking questions. *What* sort of character is this? *What* poem is this? *What* man is this we see coming?—6. *What time*, at the time or on the day when.

thirty castles, a part or some by force, a part or some by policy; or *what* may be interpreted *partly*. Sometimes *what* has no verb to govern it, and it must be considered as adverbially used. "What with carrying apples and fuel, he finds himself in a hurry;" that is, partly, in part.—10. *What* is sometimes used elliptically for *what is this*, or *how is this*?

*What!* could ye not watch with me one hour? Matt. xxvi.

**WHEAT**, *n.* [*Sax. hwate*; *Goth. hwit*; *Ice. hveitenu*; *G. weizen*; *D. weiz*.] A plant of the genus *Triticum*, and the seed of the plant, which furnishes a white flour for bread, and is by far the most important species of grain cultivated in Europe. It grows readily in almost every climate; but its natural home seems to be a temperate climate, and the soils best adapted for its culture are rich clays and heavy loams. Several species of wheat are enumerated by botanists, as summer or spring wheat (*T. aestivum*); winter wheat (*T. hybernium*), common bearded wheat (*T. turgidum*), single grained wheat (*T. monococcum*), Polish wheat (*T. polonicum*), Egyptian wheat (*T. egyptiacum*), spelter wheat (*T. spelta*). Many botanists, however, consider most of these as merely varieties, and others look upon all the cultivated wheats as varieties. Of cultivated wheats there are many varieties, but there are three principal ones which claim attention, viz., *hard wheats*, which are the produce of warm climates; *soft wheats*, which grow in the northern parts of Europe, as in Belgium, England, Denmark, and Sweden; and Polish wheats, which grow in Poland. The difference in colour between red and white wheats is owing chiefly to the soil, and, in fact, the varieties of wheat are perpetually changing in consequence of variations of culture, climate, and soil. The wheats cultivated in England are mostly varieties of the winter wheat and common bearded wheat. [*See TRITICUM*]

**WHEAT-EAR**, *n.* An ear of wheat.—

2. A small bird, the *Motacilla cinantha*,

a two-winged gnat, about the tenth of an inch long, and appears about the end of June. The females lay their eggs in clusters of from two to fifteen, among the chaffy flowers of the wheat, where they are hatched in about eight or ten days, producing little footless maggots, whose ravages destroy the flowers of the plant, and render it shrivelled and worthless. [See Hessian-FLY.]

**WHEAT-GRASS**, *n.* The common name of several British plants of the genus *Triticum*. [See TRITICUM.]

**WHEAT-PLUM**, *n.* A sort of plum.

**WHEEL**, *n.* [Sax. *hweol*, *hweoh*, *hweog*, *hweogul*; D. *wiel*; Sw. *hjul*.] A circular frame or solid disc of wood or metal turning on an axis. Wheels, as applied to carriages, usually consist of a nave, into which are inserted spokes or radii, which connect it with the periphery, or circular ring. Wheels are of various kinds; as, carriage wheels, water wheels, toothed wheels, conical wheels, fly wheels, pinions, lanterns, &c. Wheels are most important agents in machinery, being employed in a variety of forms and combinations, for the purpose of transmitting motion, regulating velocity, converting one species of motion into another, reducing friction, and equalizing the effect of forces applied in an intermittent or irregular manner. —

*Wheel and axle*, one of the mechanical powers, sometimes named the *axis in peritrochio*, consisting of a wheel with a cylindrical axis of greater or less diameter passing through its centre and turning along with it. By reference to figs. 1, 2, it will be seen that this power resolves

itself into a lever of the first order, in which the weight and power are at the ends, and the fulcrum between them. *O* is the centre, or fulcrum; *A* *O* and *O* *B* are the semi-diameters of the wheel and the axle; and on the principle of the lever the power is to the weight as *A* *O* is to *O* *B*. The wheel is grooved and carries a coil of rope; another rope is secured to the axis; and when the power is in motion, every revolution of the wheel raises the weight to a height equal to the circumference of the axis or cylinder. The power is increased by enlarging the wheel or diminishing the diameter of the cylinder; but there is a limit beyond which the increase cannot be obtained with safety. There is a modification of the wheel and axle, called the *double axis machine*, in which the power can be increased with more safety. This is shown in figure, 3, where *b* and *c* are two cylinders of different diameters, firmly fixed on the axis carrying the crank *a*. The rope is coiled round the smaller cylinder, carried through a pulley supporting the weight, and then attached to the larger cylinder in a contrary direction. When in motion, every turn of the crank lifts the weight to a height equal to half the difference between the circumferences of the two axes; and the power is therefore to the weight, as this half difference is to the circumference of the power, or the circle described by the crank *a*. Hence the power is increased by making the axes more nearly of the same diameter; but there is a limit to this increase, since if *b* and *c* come to be of equal thickness, the weight would not rise at all; the rope, in that case, wound upon *b* being only equal to that unwound from *c*. The wheel and axle is sometimes called the *perpetual lever*, in consequence of the power being continued by the revolution of the wheel. The common winch, the windlass, the capstan, and the treadmill, are so many applications of the wheel and axle; and the annexed fig. 4 shows an adaptation of the same principle to a train of wheel-work, wherein motion is regulated and power acquired. The power *F* is applied to the circumference of the wheel *A*, whose pinion drives the wheel *B*, which by another pinion gives motion to the wheel *C*, carrying an axle supporting and raising the weight *w*. The power in this combination is to the weight, as the continued product of the radii of all the wheels, to that of the radii of all the axes. —2. A circular body. —3. Under this term writers on mechanics usually include all sorts of vehicles which move on wheels, and are drawn by horses or propelled by steam; as, coaches, chaises, gigs, railway carriages, waggons, carts, &c. The use of wheels in such vehicles is twofold, viz., to lessen the friction, and to enable the vehicle more easily to overcome obstacles on the road.

**WHEEL-WINDOW**, *n.* In *Gothic arch.*, a circular window with radiating mullions resembling the spokes of a wheel. [See *CATHERINE-WHEEL*.]

**WHEEL-WORK**, *n.* In *machinery*, the combination of wheels which communicate motion to one another. Such combinations are generally reducible to the principle of the wheel and axle, though the wheel which turns the other is not always on the same axis with it. The motion in such cases is communicated from the one wheel to the other by belts or straps passing over the circumferences of both, or by teeth cut in those circumferences, and working in one another. When the resistance of the work is not great, motion may be transmitted from one wheel to another by causing their peripheries to revolve in contact with each other, by the mere friction of the surfaces in contact. The most familiar instances of wheel-work are to be found in clocks and watches.

We ascended the mountain, *from whence* we took a view of the beautiful plains below.—*Of whence* is not now used.

**WHETH'ER**, *pronoun* or *substitute*. [Sax. *hwæther*. This word seems to be connected with *what* and the *L. uter*, the latter not being aspirated. The sense seems to be *what*, or *which* of two, referring either to persons or to sentences.] 1. Which of two.

*Whether* of them twain did the will of his father? Matth. xxi.

Here *whether* is a substitute for one of two, and signifies *which*; *which* of the two; but in this sense it is obsolete.—2. Which of two alternatives expressed by a sentence or the clause of a sentence, and followed by *or*. "Resolve *whether* you will go or not;" that is, you will go or not go; resolve *which*.

*Note*.—In the latter use, *which* is now most common, *whether* is called an adverb. This is a mistake. It is the same part of speech as in the former example. The only difference is that in the former example it represents or refers to a noun, and in the latter to a sentence or clause.

**WHETH'ERING**, *n.* The retention of the after birth in cows.

**WHETSTONE**, *n.* [*whet* and *stone*.] A smooth flat stone used for sharpening edged instruments by friction. Whetstones, or *hones*, as they are sometimes called, are made of various kinds of hard close-grained stone, and when used, are moistened with oil or water.

This is the probable origin of the word, and its true sense is that of the Latin *quis*, *qualis*, *quicunque*. In these senses it occurs in all Saxon books. Its proper use was as a pronoun of interrogation, "Hwylc man is of eow?" what man is there of you? Matth. vii. 9. "Hwylc is min modor?" who is my mother? Mark iii. 33. Its use for

## WHIDAH-FINCH

*who*, Saxon *hwa*, as in the Lord's prayer, "Our father *which* art in heaven," is an improper application of the word. In its original sense it is used for all genders; as, *which* man, *which* woman, *which* thing? As an interrogative we still use it in this manner. Its use for *who* was of long continuance, but is happily discontinued; and our present practice accords with its original use in the Saxon.] 1. A pronoun or word of interrogation, in all genders; as, *which* man is it? *which* woman was it? *which* is the house?—2. In reference to *things*, or in the neuter gender, it is a relative referring to something before mentioned; as, "God rested on the seventh day from all his work *which* he had made;" Gen. ii. 2. In some phrases, the relative may precede the noun to which it refers.—3. *Which*, like other pronouns, may be used as a substitute for another word or for a sentence. "We are bound to obey all the divine commands, *which* we cannot do without divine aid." Here *which* is a substitute for *obey all the divine commands*. The man was said to be *innocent*, *which* he was not. Here *which* is a substitute for *innocent*.—4. **WHID'AH-FINCH**, A genus, *Vidua*, of several species of beautiful birds, inhabiting India and Southern and Western Africa, and found in great abundance in the kingdom of Dahomey, near Whidah. In size of body, the Whidah-finch resembles a linnet or canary-bird, and during the breeding season, the male is supplied with long, drooping, not inelegant, but certainly disproportioned tail feathers. *V. paradisæa* is of a deep brownish-black on the upper parts, but paler on the wings. The body, abdomen,

2 Red-billed Whidah (*Vidua erythrorhynchos*).

and thighs are of a pale buff, and a rich orange-rufous colour nearly surrounds its neck. *V. erythrorhynchos* is less than the former, and is of a deep glossy blue-black colour on the upper parts, with the sides of the head and

under parts white. These birds are commonly called *widow-birds*, but whether this be merely a translation of their Latin generic name, *Vidua*, which was probably given from the sombre hue of the plumage, or whether it be a corruption of *Whidah*, is uncertain.

**WHIFF**, *n.* [*W. cwif*, a whiff or puff, a hiss; *cwifaw*, to whiff, and *cwuf*, a quick gust.] 1. A sudden expulsion of air from the mouth; a puff; as the *whiff* of a smoker.

And seasons his *whiffs* with impertinent jokes. *Pope.*

2. In *ichthyology*, a flat malacopterygious fish, belonging to the family Pleuroneotidae. It is a British fish, of the turbot or flounder group, *Rhombus megastomus*, and in Cornwall is called *carter*. It is not highly esteemed for the table.

**WHIFF**, *v. t.* To puff; to throw out in whiffs; to consume in whiffs; to smoke.

**WHIFFLE**, *v. i.* [*D. weifelen*, to waver; *zweeften*, to hover. This accords in sense with *G. zweifeln*, to doubt, which would seem to be from *zwei*, two, or its root. The *G.* has also *schweifen*, to rove or wander, which seems to be allied to *sweep*. The *D.* has also *twiefelen*, to doubt, from *tree*, two, or its root; *Sw. twifla*, *Dan. trivler*, from the root of *two*. Yet *whiffle* seems to be directly from *whiff*.] To start, shift, and turn; to change from one opinion or course to another; to use evasions; to prevaricate; to be fickle and unsteady.

A person of *whiffing* and unsteady turn of mind, cannot keep close to a point of a controversy. *Watts.*

**WHIG**, *n.* [*Sax. hwæg*. See **WHEY**.] Acidulated whey, sometimes mixed with buttermilk and sweet herbs, used as a cooling beverage. [*Local.*] In *Scotland*, this term is applied to the thin serous liquid which lies below the cream in a churn, after it has become sour, and before it has been agitated.

**WHIG**, *n.* The designation of one of the great political parties in this country. The term is of Scottish origin, and was first used in the reign of Charles II. According to Bishop Burnet, it is derived from *whiggam*, a word which was used by the peasants of the south-west of Scotland, in driving their horses; the drivers being called *whiggamores*, contracted to *whiggs*. In 1648, after the news of the Duke of Hamilton's defeat, the clergy stirred up the people to rise and march to Edinburgh, and they themselves marched at the head of their parishes. The Marquis of Argyle and his party came and headed them. This was called the *whiggamores'*

## WHILST

*inroad*, and ever after that all that opposed the court came, in contempt, to be called *whiggs*; and from Scotland, the word was brought to England, where it has since continued to be used as the distinguishing appellation of the political party opposed to the *Tories*. It was first assumed as a party name by that body of politicians who were most active in placing William III. on the throne of England. Generally speaking, the principles of the whigs have been of a popular character, and their measures, when in power, tending to increase the democratic influence in the constitution. [*See TORV.*] In *American hist.*, the friends and supporters of the war and the principles of the revolution, were called *whigs*, and those who opposed them were called *tories* and *royalists*.

Pausing a *while*, thus to herself she mus'd. *Milton.*

**WHILE**, *adv.* During the time that. *While* I write you sleep.—2. As long as.

Use your memory, and you will sensibly experience a gradual improvement, *while* you take care not to overload it. *Watts.* 3. At the same time that.

Dr. Hutton made a series of experiments with a machine of this kind, with the view of ascertaining the resistance experienced by military projectiles in passing through the air.

When they occur on land they give a whirling motion to dust, sand, part of a cloud, and sometimes even to bodies of great weight and bulk, carrying them either upwards or downwards, and scattering them about in all directions. At sea they often give rise to waterpouts. They are most frequent and violent in tropical countries.

Thus in an elliptical chamber, if a person standing in one of the foci, speak in a whisper, he will be heard distinctly by a person standing in the other focus, although the same sound would not be audible at the same distance, under any other circumstances, or at any other place in the chamber. The reason is that the sounds produced in one of the foci of such a chamber, strike upon the wall all round, and, from the nature of the ellipse, are all reflected to the other focus. This serves in some measure to explain the effects of whispering galleries and domes in general. There is a whispering gallery in St. Paul's cathedral, London, and one in Gloucester cathedral.

That faculty or power of the mind by which we determine either to do or not to do, something which we conceive to be in our power; the faculty which is exercised in deciding, among two or more objects, which we shall embrace or pursue. Every man is conscious of a power to determine in things which he conceives

## WILL

to depend upon his determination. To this power we give the name of *will*; and, as it is usual, in the operations of the mind, to give the same name to the power and to the act of that power, the term *will* is often put to signify the act of determining, which more properly is called *volition*. Volition, therefore, signifies the act of willing and determining, and *will* is put indifferently to signify either the power of willing or the act. Some philosophers, however, give a more extensive meaning to the term *will*, comprehending under it not only our determination to act or not to act, but every motive and incitement to action, but this tends to confound things which are very different in their nature. The *will* is directed or influenced by the judgment. The understanding or reason compares different objects, which operate as motives; the judgment determines which is preferable, and the *will* decides which to pursue. In other words, we reason with respect to the value or importance of things; we then judge which is to be preferred; and we *will* to take the most valuable. These are but different operations of the mind, soul, or intellectual part of man. The freedom of the *will* is essential to moral action; but respecting this subject there have been great disputes among philosophers and divines.—2. Choice; determination. It is my *will* to prosecute the trespasser.—3. Choice; discretion; pleasure.

Go, then, the guilty at thy *will* chastise.

Pope.

7. Divine determination; moral purpose or counsel.

Thy *will* be done.

Lord's Prayer.

8. In law, a testament, the legal declaration of a man's intentions, as to what he wills to be performed after his death in relation to his property. In strictness of language, the term *will* is limited to land, and *testament* to personal estate. Formerly wills were either nuncupative or written; but, according to the Act 1. Vict. c. 26, (passed in 1837), by which the making of wills is now regulated, no *will*, whether of real or personal estate, is to be valid, unless it be in writing, and signed at the foot or end by the testator, or by some person in his presence, and by his direction; and such signature must be made or acknowledged by the testator in the presence of two or more witnesses present at the same time, and such witnesses must attest and subscribe the *will* in the presence of the testator, but no particular form of attestation is necessary. This act, however, does not affect the wills of soldiers on actual service, or of mariners at sea. These have the power of making nuncupative wills. In the law of Scotland, the term *will* is not used technically, at least by itself, although it is sometimes so used in combination, as in the expression *last or latter will*, which is synonymous with *testament*.

## WILLING

In popular language, however, it is employed to signify any declaration of what a person wills, with regard to the disposal of his property, heritable or movable, and thus includes not only testaments, but all the complicated forms of deeds, granted in the prospect of death.—*Will of a summons*, or other *signed letter*, in *Scots law*, that part of the writ beginning, "*Our will is*," &c.—*Good will*, favour; kindness.—2. Right intention; Phil. i.—*Ill will*, enmity; unfriendliness. It expresses less than *malice*.—*To have one's will*, to obtain what is desired.—*At will*. To hold an estate *at the will* of another, is to enjoy the possession at his pleasure, and be liable to be ousted at any time by the lessor or proprietor.—*Will with a wisp*, or *Will o' the wisp*, Jack with a lantern; ignis fatuus; a luminous appearance sometimes seen in the air over moist ground. —5. To dispose of estate and effects by testament.—6. It is sometimes equivalent to *may be*. Let the circumstances be what they *will*; that is, any circumstances, of whatever nature.—7. *Will* is used as an auxiliary verb, and a sign of the future tense. When an auxiliary verb, the past tense is *would*. It has different significations in different persons.—1. *I will go*, is a present promise to go; and with an emphasis on *will*, it expresses determination.—2. *Thou wilt go, you will go*, express foretelling; simply stating an event that is to come.—3. *He will go*, is also a foretelling. The use of *will* in the plural is the same. *We will*, promises; *ye will, they will*, foretell. [*See SHALL.*]

They are all either trees or bushes, occurring abundantly in all the cooler parts of the northern hemisphere. **WIND**, *n.* [*Sax. wind; D. and G. wind; W. gwynt; L. ventus; Fr. vent*.]

This word accords with *L. venio, ventum*, and the Teutonic *wendana*, Eng. *went*. The primary sense is to move, flow, rush, or drive along.] 1. Air in motion with any degree of velocity, indefinitely; a current of air; a current in the atmosphere, conveying the air with greater or less velocity from one part to another; a current as coming from a particular point. When the air moves moderately, we call it a light wind or a breeze; when with more velocity, we call it a fresh breeze; and when with violence, we call it a gale, storm, tempest, or hurricane. The word *gale* is used by the poets for a moderate breeze, but seamen use it as equivalent to *storm*. The principal cause of those currents of air to which we give the name of *winds*, is the disturbance of the equilibrium of the atmosphere by the unequal distribution of heat. When one part of the earth's surface is more heated than another, the heat is communicated to the air above that part, in consequence of which the air expands, becomes lighter, and rises up,

## WIND

while colder air rushes in to supply its place, and thus produces wind. As the heat of the sun is greatest in the equatorial regions, the general tendency there is for the heavier columns of air to displace the lighter, and for the air at the earth's surface to move from the poles toward the equator. The only supply for the air thus constantly abstracted from the higher latitudes must be produced by a counter-current in the upper regions of the atmosphere, carrying back the air from the equator towards the poles. The quantity of air thus transported, by these opposite currents, is so nearly equal, that the average weight of the air, as indicated by the barometer, is the same in all places of the earth. Besides the unequal distribution of heat already mentioned, there are various other causes which give rise to currents of air in the atmosphere, such as the chemical changes which are carried on in the air, the condensation of the aqueous vapours which are constantly rising from the surfaces of rivers and seas, and the agency of electricity. Winds have been divided into *fixed* or *constant*, as the trade winds; *periodical*, as the monsoons; *land and sea breezes*; and *variable winds*, or such as blow at one time from one point; at another from another point; and at another time cease altogether. [See **TRADE WINDS**, **MONSOONS**, **LAND AND SEA BREEZES**.] There are also various local winds, which receive particular names; as the *Etesian wind*, the *Sirocco*, the *Samiel* or *Simoom*, the *Harmattan*, &c. [See these terms.] The velocity of the wind varies from one that is hardly sensible, to one of 100 miles in an hour. *Winds* are denominated from the point of compass from which they blow; as, a *north wind*; an *east wind*; a *south wind*; a *west wind*; a *southwest wind*, &c.—2. The *four winds*, the cardinal points of the heavens.

Come from the *four winds*, O breath, and breathe upon these slain; Ezek. xxxvii.

For this purpose, one of the slips is placed across one end of the board, and the other across the other end, with one of the straight-edges of each upon the surface. The joiner then looks in a longitudinal direction over the upper edges of the two slips, and if he finds that these edges coincide throughout their length, he concludes that the surface is *out of winding*; but if the upper edges do not coincide, this is a proof that the surface winds. [*See WINDING*.]

**WIND'-INSTRUMENT**, *n.* An instrument of music, played by wind, chiefly by the breath; as a flute, a clarinet, &c. Wind instruments generally produce their effects by the vibrations of a column of air in a tube, shut at one end, and either open or shut at the other. These vibrations are determined mainly by the length of the sounding column; yet inferior and subordinate ones are found to co-exist with the fundamental one. The whole column spontaneously divides itself into portions equal to the half, the third, or the fourth of its longitudinal extent, and thus different sounds are produced. The finger holes, and keys of wind instruments, are contrivances for varying the length of the sounding column, and thus producing different tones.

**WIND'LASS**, *n.* [*wind* and *lace*. *Qu.*] In mech., a modification of the wheel and axle, used for raising weights, &c. The common windlass, such as is used for raising water from wells, &c., consists simply of an axle, which is turned by a winch. One end of a rope or

## WIND-MILL

chain being attached to the axle, and the other to a weight, by turning the winch, the rope is coiled on the axle, and thus the weight is raised. The windlass used in ships for raising the anchors, or obtaining a purchase on other occasions, consists of a strong beam of wood placed horizontally, and supported at its ends by iron spindles, which turn in collars or bushes inserted in what are termed the *windlass bitts*,

Ship's Windlass.

This large axle is pierced with holes directed towards its centre, in which long levers or handspikes are inserted, for turning it round when the anchor is to be weighed or any purchase is required. It is furnished with *pauls* to prevent it from turning backwards when the pressure on the handspikes is intermitted. It is sometimes written *windlace*. Improved patent windlasses are now extensively used in ships.—2. *†* A handle by which any thing is turned.

**WIND'-MILL**, *n.* [*wind* and *mill*.] A mill which receives its motion from the impulse of the wind, and which is used for grinding corn, pumping water, &c. There are two kinds of wind-mills, the *vertical* and *horizontal*. In the former, a section of which is here given,

Section of upper part of Wind mill.

the wind is made to act upon sails or vanes, a *A* (generally four in number), attached by means of rectangular frames to the extremities of the principal axis or *wind-shaft* of the mill, which is placed nearly horizontal, so that the sails, by the action of the wind, revolve in a plane nearly vertical, giving a rotatory motion to the driving wheel, *B*, fixed to the wind-shaft, and thus conveying motion to the vertical shaft, *C*, and the machinery connected with

It. The extremity of the wind-shaft must always be placed so as to point to the quarter from which the wind blows. To effect this, some mills have a self-adjusting cap, *b*, which is turned round by the force of the wind acting upon the fan or flyer, *c*, attached to the projecting frame-work at the back of the cap. By means of a pinion on its axis, motion is given to the inclined shaft, and to the wheel, *d*, on the vertical spindle of the pinion, *a*, this latter pinion engages the cogs on the outside of the fixed rim of the cap; by these means the sails are kept constantly turned to the wind, the head of the mill moving slowly round, the moment any change in the direction of the wind causes the fan, *c*, to revolve. In the horizontal wind-mill, the wind-shaft is vertical, so that the sails revolve in a horizontal plane. The effect of horizontal wind-mills, however, is considered to be far inferior to that of the vertical kind. The effect of wind-mills depends greatly upon the form and position of the sails.

**WIND'OW**, *n.* [*Dan. vindue*; *Sp. ventana*, from the same root as *venta*, sale, of goods. The word in Spanish signifies also a nostril, that is, a passage. *Ventaja* is advantage; *ventalla*, a valve, and *ventalle*, a fan; *ventear*, to blow. Hence we see that *vent*, *L. vendo*, wind, *fen*, and *van*, *Fr. avant*, are all of one family. So is also the *L. fenestra*, *Fr. fenêtre*, *D. venster*, *G. fenster*, *Ir. fineog*. The vulgar pronunciation is *windor*, as it from the Welsh *gwyndor*, wind-door.] 1. An opening in the wall of a building for the admission of light, and of air when necessary. This opening has a frame on the sides, in which are set movable sashes, containing panes of glass. The fermented juice of the grape, or of the fruit of the vine, (*vitis vinifera*. *See Vitis*).

Wines are distinguished practically, by their colour, hardness or softness on the palate, their flavour, and their being still or effervescing. The differences in the quality of wines depend partly upon differences in the vines, but more on the differences of the soils in which they are planted, in the exposure of the vineyards, in the treatment of the grapes, and the mode of manufacturing the wines. When the grapes are fully ripe, they generally yield the most perfect wine as to strength and flavour. The leading character of wine, however, must be referred to the alcohol which it contains, and upon which its intoxicating powers principally depend. The most celebrated ancient wines were those of Lesbos and Chios among the Greeks, and the Falernian and Cecuban among the Romans. The principal modern wines are Port, Sherry, Claret, Champagne, Madeira, Hock, Marsala, Cape, with their varieties. The wines most used in this country are Port and Sherry, especially the former. The wines intended for the English market, are mixed with a large quantity of brandy. Genuine unmixed port wine is very rarely met with in this country.—2. Wistonwith (Arctomys ludovicianus).

*ing squirrel*, *burrowing squirrel*, and *prairie dog*.

**WIT**, *v. i.* [Sax. *witan*, Goth. *witan*, D. *weten*, G. *wissen*, to know; Sans. *vid*. See *WISE*.] To know; to be informed; to be known. This verb is used only in the infinitive, to *wit*, when it is an adverbial phrase, signifying, namely, that is to say. [L. *videlicet*, i. e. *videre licet*.] In *law*, it is used as a formal expression, by which a county or other district is called upon to *know* or to *witness* the legal setting forth of something that follows. [See *VIDELICET*.]

**WIT**, *n.* [Sax. *wit* or *ge-wit*; G. *witz*; Dan. *vid*. See the verb and *WISE*.]—

1. Primarily, the intellect; the understanding or mental powers collectively. Will puts in practice what the *wit* deviseth. Davies. For *wit* and power their last endeavours bend

T' outshine each other. Dryden.

2. The association of ideas in a manner natural, but unusual and striking, so as to produce surprise joined with pleasure. Wit is defined

What oft was thought, but ne'er so well express'd. Pope.

Wit consists in assembling and putting together with quickness, ideas in which can be found resemblance and congruity, by which to make up pleasant pictures and agreeable visions in the fancy. Locke.

Wit consists chiefly in joining things by distant and fanciful relations, which surprise us because they are unexpected.

Kames.

Wit is a propriety of thoughts and words; or in other terms, thoughts and words elegantly adapted to the subject. Dryden.

3. The faculty of associating ideas in a new and unexpected manner.—4. A man of genius; as, the age of Addison abounded with *wits*.

5. A man of fancy or wit. Intemperate *wits* will spare neither friend nor foe. L'Estrange.

6. Sense; judgment. He wants not *wit* the danger to decline. Dryden.

7. Faculty of the mind.—8. *Wits*, in the plural, soundness of mind; intellect not disordered; sound mind. No man in his *wits* would venture on such an expedition. Have you lost your *wits*? Is he out of his *wits*?—9. Power of invention; centrivance; ingenuity. He was at his *wits' end*.—10. Among *phrenologists*, the faculty which produces the sentiment of the ludicrous, and gives the tendency to view objects in that light. When combined with *destructiveness* it produces satire, and

## WITCH

when combined with *secretiveness* it produces humour. Its organ is situated at the side of the upper part of the forehead, between causality and ideality.

*Note*.—It is difficult to give any strict definition of the term *wit*, its precise boundaries being still too unsettled. It has passed through a greater variety of significations in the course of the last two centuries than most other terms in the English language. Originally, *wit* signified wisdom; and anciently, a man of *witte* was a wise man. In the reign of Elizabeth, a man of pregnant *wit*, or of great *wit*, was a man of vast judgment. In the reign of James I. *wit* was used to signify the intellectual faculties or mental powers collectively. In the time of Cowley it came to signify a superior understanding, and more particularly a quick and brilliant reason. By Dryden it is used as nearly synonymous with talent or ability. According to Locke, it consists in quickness of fancy and imagination. Pope defined *wit* to be a quick conception and an easy delivery; according to which, a man of *wit*, or a *wit*, is a man of brilliant fancy; a man of genius. At present, *wit* is used to designate a peculiar faculty of the mind, connected with the more comprehensive faculty of the imagination; and also the effect produced by this faculty, which consists in the display of remote resemblances between dissimilar objects, or an unexpected combination of remote resemblances; in the exhibition or perception of ludicrous points of analogy or resemblance among things in other respects dissimilar. Hence, a man of *wit*, or a *wit*, is considered to be a man in whom a readiness for such exercise of the mind is remarkable. It is evident that *wit* excites in the mind an agreeable surprise, and that arising, not from any thing marvellous in the subject, but solely from the imagery employed or the strange assemblage of related ideas presented to the mind. This end is effected, 1, by debasing things pompous or seemingly grave; 2, by aggrandizing things little and frivolous; or, 3, by setting ordinary objects in a particular and uncommon point of view, by means not only remote, but apparently contrary. Hence arise a great many kinds of wit. Wit is often joined with humour, but not necessarily so; it often displays itself in the keenest satire; but when it is not kept under proper control, or when it becomes the habitual exercise of the mind, it is apt to impair the nobler powers of the understanding, to chill the feelings, to check friendly and social intercourse, and to break down those barriers which have been established by courtesy. At the same time, when kept within its proper sphere, and judiciously used, it may be rendered very effective in attacking pedantry, pretension, or folly, and may also be employed as a powerful weapon against error.

**WITCH**, *n.* [Sax. *wicca*. See *WICKED*.]

WITCH-CRAFT, *n.* [*witch* and *craft*.]

The practices of witches; sorcery; enchantments; intercourse with the devil; a supernatural power, which persons were formerly supposed to obtain possession of by entering into compact with the devil. Indeed it was fully believed that they gave themselves up to him, body and soul, while he engaged that they should want for nothing, and be able to assume whatever shape they pleased, to visit and torment their enemies, and accomplish their infernal purposes. As soon as the bargain was concluded, the devil was said to deliver to the witch an *imp* or familiar spirit, to be ready at call, and to do whatever it was directed. By the aid of this *imp* and the devil together, the witch, who was almost always an old woman, was enabled to transport herself through the air on a broomstick or a spit, and to transform herself into various shapes, particularly those of cats and hares; to inflict diseases on whomsoever she pleased, and to punish her enemies in a variety of ways. The belief in witchcraft is very ancient. It was universally believed in Europe till the 16th century, and even maintained its ground with tolerable firmness till the middle of the 17th century. Vast numbers of reputed witches were condemned to be burned every year, so that in England alone it is computed that no fewer than 30,000 of them suffered at the stake.—2. Power more than natural.

The meetings of this council were frequent; they formed the highest court of judicature in the kingdom; they were summoned by the king in any political emergency; their concurrence was necessary to give validity to laws, and treaties with foreign states were submitted to their approval. They had even power to elect the king, and if the sceptre descended

in his race, it was by means of the formal recognition of the new king by the nobles, bishops, &c., in an assembly convened for the purpose.

15. In consent, noting purity of state. See! where on earth the flow'ry glories lie, *With* her they flourish'd, and *with* her they die. *Pope*.

*With* and *by* are closely allied in many of their uses, and it is not easy to lay down a rule by which their uses may be distinguished. It is observed by Johnson that *with* seems rather to denote an instrument, and *by* a cause; as, he killed an enemy *with* a sword, but he died *by* an arrow. But this rule is not always observed. *With*, in composition, signifies sometimes opposition, privation; or separation, departure.

WITHAL, *adv.* (*withan*.) [*with* and *all*.] *With* the rest; together *with*; likewise; at the same time.

—9. Unless; except.—*Without*, when it precedes a sentence or member of a sentence, has been called a conjunction. This is a mistake. "You will not enjoy health, *without* you use much exercise."

In this sentence, *without* is a preposition still, but followed by a member of a sentence, instead of a single noun. It has no property of a connective or conjunction, and does not fall within the definition. You will not enjoy health, this fact following being removed, or not taking place; *you use exercise*. This use of *without*, is nearly superseded by *unless* and *except*, among good writers and speakers; but is common in popular discourse or parlance.

vated.] A plant of the genus *Isatis*, the *I. tinctoria*, formerly cultivated to a

great extent in Britain, on account of the blue dye extracted from it. It is now, however, nearly superseded by indigo, which gives a stronger and finer blue. It is still cultivated to a considerable extent in the south of France and Flanders, and the dye which it furnishes is said to improve the quality and colour of indigo, when mixed with it in a certain proportion. The colouring matter is obtained from the leaves of the plant. These are first dried, then ground or bruised by machinery, and formed into a sort of paste. This paste is formed into balls, which are allowed to ferment and fall into a dry powder, which is sold to the dyer. The ancient Britons are said to have tintured their bodies with the dye procured from the woad plant.—*Wild woad*, *weld*, or *wold*, is the *Reseda luteola*, a British plant, which yields a beautiful yellow dye. habits and physical development closely related to the dog. The common European wolf is yellowish or fulvous-gray; the hair is harsh and strong, the tail straight, or nearly so, and there is a blackish band or streak on the fore-legs about the carpus. The height at the shoulder from 27 to 29 inches. The wolf is a crafty, greedy, and ravenous animal; the sheep-cote and the farm-yard become the scenes of his ravages, and the size and speed of the elk and of the stag are not sufficient to protect them from his violence, his swiftness, and his cunning. When pressed by famine, he becomes dangerous to man, falling at unawares upon the solitary and unprotected traveller, and carrying off the defenceless children of the villager. Sometimes wolves pursue their prey in companies, which separate again as soon as the object of the pursuit is attained. The common wolf infests the western countries of Europe, and once lurked in the uncleared woody districts of Britain. There are several species of wolf; as, the *black-wolf* of Southern Europe, and particularly of the Pyrenees, and south of those mountains; the *red-wolf* of South America. Several varieties of the common wolf are found in North America.—2. Any thing ravenous or destructive.—3. A small white worm or maggot, which infests granaries.—4. An eating ulcer.—5. It is a common plant in flower borders, and is found in a wild state in one or two parts of England. All the parts of the plant are extremely acrid, especially the roots. The juice of the leaves introduced into the stomach is said to occasion death in a short time, but the powdered root is far more energetic. The poison acts upon the nervous system, especially the brain, producing a sort of phrenzy. The plant is used in medicine in cases of neuralgia.

"By pleasure and pain, I *would* be understood to mean what delights or molests us;" that is, *if it should be asked* what I mean by pleasure and pain, I *would* thus explain what I wish to have understood. In this form of expression, which is very common, there seems to be an implied allusion to an inquiry, or to the supposition of something not expressed. *Would* has the sense of *wish* or *pray*, particularly in the phrases, "*would* to God," "*would* God we had died in Egypt," "I *would* that ye knew what conflict I have;" that is, I *would* wish such a thing, *if* the wish could avail. retort, into which the materials required to generate the gas or vapour are introduced. It communicates with a receiver *b*, connected with the three necked bottles *c* and *d*, by means of bent tubes. These bottles are about half filled with the fluid to be impregnated, the gas flowing through one into the other, until it escapes by the bent pipe *e*, and is again collected under a pneumatic trough. In order to compensate for the pressure of the external air, when any absorption takes place which might tend to force the fluid from the bottles back into the receiver *b*, each one is provided with a safety tube *f*, open at the top, which dipping little more than half an inch under the surface of the fluid, permits sufficient air to enter as a compensation for absorption.

poison, used on arrows and other weapons, and made by the Indians by a peculiar process of decoction, cooling, mixing, and reboiling from the bark and juices of several plants. The substance which enters most largely into its composition, and which is probably the only essential ingredient, is the bark of *Strychnos tozifera*, called the *Urari*

Wourali poison tree (*Strychnos tozifera*).

vine, hence the name. Some accounts state ants, snake-fangs, and red pepper to be ingredients, but these do not at all events seem to be essential. The effects of this poison are very extraordinary, acting virulently when affecting the blood; while in small quantities it may be taken into the stomach with impunity. A well fed ox, inoculated with the poison in three non-vital parts of the body, died in twenty-five minutes. It has been suggested as likely to prove useful, when taken medicinally, in curing lock-jaw and hydrophobia.

Hence it has happened that in a great number of words, *g* has been changed into *y*, as the Sax. *gear*, into *year*; *geornian*, into *yearn*; *gyllum*, into *yell*; *gealew*, into *yellow*. In the middle and at the end of words, *y* is precisely the same as *i*. It is sounded as *i* long, when accented, as in *day*, *rely*; and as *i* short, when unaccented, as in *vanity*, *glory*, *synonymous*. This latter sound is a vowel. At the beginning

1. The period of time during which the earth makes one complete revolution in its orbit, or it is the space or period of time which elapses between the sun's leaving either equinoctial point, or either tropic, and his return to the same. This is the solar year, and the year, in the strict and proper sense of the word. It is called also the tropical year. This period comprehends what are called the twelve calendar months. It is not quite uniform, but its mean length is about 365 days, 5 hours, 48 minutes, and 48 seconds. The return of the seasons depends upon it. In popular usage, however, the year consists of 365 days, and every fourth year of 366; a day being added to February, on account of the excess of the solar year above it.—2. The time in which any planet completes a revolution; as, the year of Jupiter or of Saturn.—3. The horse is ten *year* old.—*Sidereal year*, the time between the sun's leaving any point among the fixed stars and his return to the same; that is, the time of the sun's apparent revolution in the ecliptic. This is 365 days, 6 hours, 9 minutes, and 11.5 seconds. The excess of the sidereal above the solar year, arises from the retrograde motion of the equinoctial points, owing to which the sun returns to either equinoctial point or either tropic, before returning to the same fixed star.—*Anomalistical year*, the time that elapses from the sun's leaving its apogee, till it returns to it; which is 365 days, 6 hours, 14 minutes nearly.—*Civil year*, the year of the calendar, consisting of 365 days, and every fourth year of 366 days.—*Bissextile or leap year*, the year consisting of 366 days.—*Lunar year*, consists of 12 lunar months.—*Lunar astronomical year*, consists of 12 lunar synodical months, or 354 days, 8 hours, 48 minutes, 36 seconds.—*Common lunar year*, consists of 12 lunar civil months, or 354 days.—*Embolismic or intercalary year*, consists of 13 lunar civil months, and contains 384 days.—*Julian year*, established by Julius Cesar, consists of 365 days, 6 hours.—*Gregorian year*, is the Julian year corrected, and is the year now generally used in Europe. From the difference between this and the Julian year, arises the distinction of Old and New Style. [See **STYLE**.]—*Sabbatic year*, among the Israelites, was every seventh year, when their land was suffered to lie untilled. The *civil or legal year*, in England, formerly commenced on the 25th day of March. This practice continued throughout the British dominions till the year 1752. It dissolves in acids, forming sweetish salts, which have often an amethyst colour. It has no action on vegetable colours. *Yttria* seems to be a protoxide of yttrium, its metallic base. **YTTRIO-COLUMBITE**, *n.* A mineral species, of which there are three varieties—the yellow, the dark, and the black—found at Ytterby, in Sweden. They are composed of *columbic acid*, *yttritic acid*, *yttria*, *lime*, *oxide of uranium*, and *oxide of iron*, the principal ingredients being *columbic acid* and *yttria*. The whole are infusible before the blow-pipe; but they decompose, and assume a light colour. **Z**, THE last letter of the English Alphabet, is a sibilant articulation, and is merely a vocal *S*. It bears the same relation to *s*, as *v* does to *f*. With us it has not a compound sound, nor is it a double consonant, as in the Italian and German. It is as simple in its sound as *S*. The words in English which begin with *z*, are all derived from other languages, mostly from the Greek. As a numeral, *Z* stands for 2000, and with a dash over it, *Z̄*, for 2,000,000. It is pronounced *zed*, and its vulgar or local name is *izzard*.

mucilaginous juice which has a nauseous odour, and an unpleasant taste, arising from the existence in it of a peculiar proximate principle. This may be removed by boiling, roasting, &c., when some of them form a nutritious article of food. The pith of *Z. cycadis*, Bread-tree *Zamia*, after being prepared in a particular way, is formed into cakes, baked, and eaten by the Caffres and Hottentots. *Z. spiralis* produces large cones composed of nuts about the size of a chestnut, which are eaten by the natives of New Holland.

Zebra (*Equus zebra*).

Southern Africa, nearly as large as a horse, white, with numerous brownish-black bands of greater or less intensity, and lighter down the middle of each band. The zebras graze in herds on the steep hill side, and seek the wildest and most sequestered spots, so that they are extremely difficult of approach, not only from their watchful habits and great swiftness of foot, but also from the inaccessible nature of their abode. They are incapable of being tamed, unless they are taken very young. There is another species of zebra, *E. burchellii*, which inhabits the plains of South Africa, beyond the Orange river. It is a beautiful animal, having the ears and tail more like those of the horse than the preceding species, which approaches the ass in these particulars. It admits of being tamed to a certain extent, but even in its most tractable state it is described as wicked, treacherous, obstinate, and fickle. The zebras belong to the family that contains the horse and the ass.

To assist him in the collection of these, the police of the district is under his control, and he holds a police court. A portion of land is assigned to him as subsistence-allowance, and as collector of the revenue he has a per centage (generally ten per cent.) upon the amount collected. In those districts, however, which are in the possession of the British government, the zemindars are recognized as hereditary proprietors of the soil, and the amount of revenue to be paid to government is settled at a fixed rate.

It is also used in trigonometrical surveys for determining the difference of latitude of two stations, by observing the difference of the zenith distances of the same star, at the two stations, as it passes the meridian. It consists essentially, as its name implies, of a portion of a divided circle. [See *SECTOR*.]

**ZE'OLITE**, *n.* [Gr. *zeo*, to boil, to foam, and *lithos*, stone.] A class of earthy minerals, so named originally by Cronstedt, from their boiling and swelling when heated by the blow-pipe. Many substances have been confounded under this name, particularly such as are fusible by the blowpipe without addition, and exhibit a phosphoric brilliancy at the moment of fusion. Häuy makes two species of zeolite, which he calls mesotype and stilbite. Werner makes four subspecies, which he calls mealy zeolite, fibrous zeolite, radiated zeolite, and foliated zeolite. He makes zeolite a generic name, and Jameson, who adopts this theory, arranges in this family prehnite, zeolite, apophyllite, cubicite, called by Häuy analcime, chabasite, cross-stone, laumontite, diopside, natrolite, and wavellite. According to Dr. Thomson, the zeolites, chemically considered, are double hydrous, aluminous silicates. Under this head are included apophyllite, tale, harmotome, ittenrite, karpfolite, leynite, laumontite, mesolite, natrolite, pyrophyllite, steatite, thomsonite, agalmatolite, analcime, chabasite, comptonite, stilbite, zeaxite, and various other minerals.

**ZINC**, *n.* [G. Sw. and Dan. *zink*] A metal frequently called *spelter* in commerce. It has a strong metallic lustre, and a bluish white colour. Its texture is lamellated and crystalline, and its specific gravity about 7. It is a hard metal, being acted on by the file with difficulty; and its toughness is such as to require considerable force to break it when the mass is large. At low or high degrees of heat it is brittle, but between 250° and 300°, it is both malleable and ductile, and may be rolled or hammered into sheets of considerable thinness, and drawn into wire. Its malleability is considerably diminished by the impurities which the zinc of commerce contains. It fuses at 773°, and when slowly cooled, crystallizes in four or six sided prisms. Zinc undergoes little change by the action of air and moisture. When fused in open vessels, it absorbs oxygen and forms the white oxide called *flowers of zinc*. Heated strongly in air it takes fire and burns with a beautiful white light, forming oxide of zinc. Zinc is found in considerable abundance. It does not occur in the native state, but is obtained from its ores which are chiefly the sulphuret, or *zinc blende*, and the carbonate or *calamine*. The oxide of zinc is a fine white powder insoluble in water, but very soluble in acids which

## ZIRCONIA

it neutralizes, being a very powerful base, of the same class as magnesia. It combines also with some of the alkalis. Several of the salts of zinc are employed in medicine, as the sulphate or *white vitriol*, the chloride or *butter of zinc*, the acetate and the cyanuret. Sheet-zinc is now largely employed for lining water cisterns, baths, &c., for making spouts, pipes, for covering roofs, and several other architectural purposes. Plates of this metal are used as generators of electricity in voltaic batteries, &c.; they have also been recently employed in the operation of transferring printing. Zinc is much employed in the manufacture of brass and other alloys. A new application of this metal has been lately announced, namely, that of producing what is termed the *electric light*, to be used as a substitute for gas.

**ZOOLOGY**, *n.* [Gr. *zōon*, an animal, and *λογία*, discourse.] That part of natural history which treats of the structure, habits, classification, habitations, &c., of all animals, from man to the lowest of all the tribes. Thus zoology treats of all those beings comprised in the term "animal kingdom." It embraces *comparative anatomy*, *animal physiology*, and all the great questions relating to the succession of species of animals upon the earth, the parts which they play in the theatre of nature, and the geographical distribution of existing species; another branch, termed *descriptive zoology*, is restricted to the outward characters, habits, properties, and the classification of animals. Various systems of classification have been framed by zoologists. Linnaeus divided the animal kingdom into six classes, viz., *mammalia*, *birds*, *fishes*, *amphibians*, *insects*, and *worms* (vermes). Cuvier gives a more definite arrangement. He divides the animal kingdom into four sub-kingdoms, viz., *vertebrata*, *mollusca*, *articulata*, and *radiata*. [See *these terms*.] The term *zoology* is sometimes used in a more restricted sense, to signify the natural history of quadrupeds or mammalia, which, however, is more correctly termed *therology*, and is thus distinguished from *ornithology*, *ichthyology*, *entomology*, &c.

*zoophytes*, or *zoophyta*, form a great division of the animal kingdom, comprehending beings which are always evidently more simple in organization than in the other divisions, and which have their parts more or less distinctly arranged round an axis, a disposition which frequently gives them the shape of flowers, and hence the name, which signifies *living plants*, or *plant-like animals*. This division contains the starfishes and sea-eggs, as well as the actiniae, corals, and corallines. Cuvier applies the name *radiata* to the zoophytes, and arranges them under five classes, viz., *echinodermata*, *entozoa*, or intestinal worms, *aculephata*, or sea-nettles, *polypti*, and *infusoria*.

## PROSPECTUS.

THE object of this Work is to present to the Agricultural reader the whole of the truth immediately connected with his profession, so far as it is known to the men most familiar with the sciences it involves, the methods it employs, and the risks it incurs. For this purpose, every topic requiring discussion has been placed in the hands of those with whom it has been a matter of personal experience and study.

Agriculture is so extensive a subject, that no one writer can speak from personal knowledge on all its departments; and it is a subject so variable with circumstances, and therefore so liable to misrepresentation, that no other kind of knowledge is worth communicating. Many previous attempts have been made to condense in one Work all existing information on Agricultural affairs; but the Authors, or Editors, however skilful in recording their own experience, and however successful there, have never had equal success in conveying the experience of others. The Agriculturist, in daily contact with Nature, requires the assistance of those who have had personal acquaintance with her laws and requirements: writers retailing an experience at second hand upon these points, can neither be accurate nor full enough for his purpose.

In offering, therefore, to the Agriculturists of Great Britain a CYCLOPEDIA OF AGRICULTURE, PRACTICAL AND SCIENTIFIC, intended to be a standard book of reference on all the subjects of which it treats, we should greatly mistake the exigencies of the times did we present a mere compilation of bygone information, which, however interesting in itself, can be of little real use to the practical man.

The only way in which the knowledge of his art can be brought down to the present day; its various methods—detailed with accuracy for his information; and the explanations given of their success or failure, which the now more perfect Theory of Agriculture has furnished; is to place every department of the wide subject in the hands of those who have made it their especial study.

To accomplish this desirable object has been the great aim of the Editor and Publishers of the *CYCLOPEDIA OF AGRICULTURE*; and for this purpose the assistance of our most distinguished agricultural writers has been engaged. Each separate topic will be discussed by its own student, in order that the whole may be presented as perfectly as possible. The reader will therefore receive no mere compilation of other works—he will, in every section of the subject, be instructed by the man who has made it his especial study. Thus, even in the “Calendar of Farm Operations,” which might, perhaps harmlessly, have been a mere abstract of previous publications on farm practice, the successive sentences have been penned by those who have themselves carried out the processes described, or the instructions suggested: and in that one appendage to the Work, the details of farm operations are given as actually practised in twenty different counties of Scotland and England by more than twenty of our most successful farmers and cultivators.

As regards the body of the Work, the names of its writers,—a list of which is appended to this Prospectus,—are sufficient guarantee for the practical value of the performance. A Work on the Theory and Art of Agriculture, of which the several departments are undertaken by such contributors, may well command confidence.

The Dictionary form has been adopted, as the most accessible, and admitting of the easiest reference. But care will be taken to avoid frittering away the contents down to a succession of mere dictionary definitions: the various sections of the Science and Practice of Farming will be discussed in substantial readable articles; interspersed, however, with shorter illustrated statements descriptive of the grasses and the weeds of the farm; and the Entomological department will also be distributed through the Work, so as to destroy any risk of a dull or monotonous appearance pervading it. And it may be advisable to add, that while it will be the aim of every writer to give information to the cultivator which shall be useful in the field and in actual farm practice, the requisite clearness and precision of its arrangement will often render the use of *scientific* terms unavoidable, in consequence of those which are, in ordinary use, or are merely provincial, conveying different ideas in different localities. Thus, while the articles on the cultivation of oats, barley, rye, wheat, &c., are given under the ordinary names of their plants, about which no mistake can arise, those which describe our various weeds, grasses, and insects, will be given under their *scientific* names, for their popular names are too variable in their signification to be used with safety. The provincial names, wherever known, will be inserted in their proper alphabetical position, with references to the titles under which the subjects are treated. This seems necessary to be said, lest any one, by a cursory examination of the early numbers of the Work should be led, by the frequent appearance of botanical and entomological titles, to conceive that any of the articles it contains are written merely for the scientific reader. This would be altogether a mistaken idea: for we repeat, that the Work is designed strictly and exclusively for the useful information of the practical farmer and agricultural student.

Illustrations on wood and steel, of Farm Buildings, Insects, Plants, cultivated and uncultivated, Agricultural Machines, Implements and Operations, &c., will be given wherever it is presumed they can be useful.

#### CONDITIONS.

The Work will be published in Parts, 2s. 6d. each, Super Royal 8vo. It is expected that the whole will be completed in about 24 Parts; but a considerable portion of the Book being yet to be received from the Contributors, it is not possible to say the precise number of Parts to which it will extend. However, it is the desire both of the Editor and Publishers to restrict the Work as nearly to the extent indicated as may be found consistent with fully carrying out the plan sketched in the Prospectus.

THE  
**IMPERIAL FAMILY BIBLE;**

CONTAINING THE OLD AND NEW TESTAMENTS,

According to the most correct copies of the authorized version; with many thousand Critical Explanatory, and Practical Notes; also, References, Readings, Chronological Tables, and Indexes.

THE WHOLE ILLUSTRATED BY

A SUPERB SERIES OF ENGRAVINGS, FROM THE OLD MASTERS,

AND FROM ORIGINAL DESIGNS, BY JOHN MARTIN, K.L.

THE Edition of the HOLY SCRIPTURES now offered to the Public requires little to be said in the way of introduction. Whilst in every department of human learning, the painter and engraver have co-operated with the printer to beautify and embellish literature, it has been frequently observed, that no edition of the Sacred Volume existed, sufficiently high in the style of its Embellishments and Typography, to secure a place in the library of the learned and affluent, and, at the same time, so moderate in price and accessible in its mode of publication, as to fall within the reach of the humblest classes of the community.

THE TEXT, which is that of the most correct copies of the authorized version, is accompanied by all the marginal readings usually printed therewith, and which form a very important part of the translation.

THE REFERENCES to PARALLEL TEXTS are very numerous and accurate, and embody the most valuable of those given by Blayney, Brown, Clarke, and Scott.

THE NOTES, amounting to many thousands, are chiefly selected from the great Commentators and Illustrators of the Scriptures, among whom may be named HENRY, SCOTT, CLARKE, PATRICK, BOOTHROYD, DODDRIDGE, CAMPBELL, LOWTH, BLAYNEY, BUSH, BARNES, JAHN, HALES, BURDER, PAXTON, MANSFORD, and many others too numerous to mention. The Notes are necessarily concise; but though the space occupied by them is apparently small, they would, if printed in the usual form, exhibit an amount of matter, and certainly of information, very much greater than what is usually given in Family Commentaries.

Each Book is accompanied by INTRODUCTORY and CONCLUDING REMARKS, illustrative of the subjects therein contained, together with the chronology of various periods and epochs.

THE GENERAL INTRODUCTION to the whole work contains—Arguments for the necessity of a Divine Revelation,—The fact of a Revelation,—The Genuineness, Authenticity, and Inspiration of the Scriptures,—Laws, Types, and Customs of the Jews,—and the Geography and History of Nations, &c. &c.

INDEX AND TABLES. A full *Chronological Index* is appended, giving the dates according to the common computation, as well as that of Hales; together with numerous *Tables* fitted to facilitate the study of the Sacred Volume: and to the whole is added, a very much enlarged and improved Edition of the Rev. Mr. Barr's invaluable *Index* of Subjects, and Concise Dictionary of Terms in the Holy Scriptures.

ENGRAVED ILLUSTRATIONS. In the Illustrative Department, the Publishers have selected from the WORKS OF THE OLD MASTERS, a variety of subjects not only novel but most exquisite in treatment. They have also, at great expense, secured the services of JOHN MARTIN, K.L., whose name and paintings must ever stand in happy connection with the Sacred Volume. NINE subjects have been supplied by this great master of art, including those *chef-d'œuvre* of his skill—"THE DELUGE," "BELSHAZZAR'S FEAST," and "THE CRUCIFIXION."

The Work is published in THIRTY-EIGHT PARTS, at 2s. 6d. each; every part is embellished with a Superb Engraving, equal in value to the entire price of the Part, and along with the concluding one an unique and beautiful Family Register is given.

"Admirably well suited to family use."—*Spectator*.

"A noble and beautiful edition of the Sacred Volume. No copy has ever been placed before us distinguished by so many excellencies."—*Art Union*.

# COMPREHENSIVE FAMILY BIBLE;

CONTAINING THE OLD AND NEW TESTAMENTS,

According to the most correct copies of the Authorized Version; with Copious Critical and Explanatory Notes, and Practical Reflections; also, References, Readings, Chronological, and other Tables. By DAVID DAVIDSON, author of the "Pocket Commentary," "Dictionary of the Bible," &c. Accompanied by a series of Historical Designs, and Numerous Authentic Views, illustrative of the Countries of the Bible and the Fulfilment of Prophecy.

EDITIONS of the Holy Scriptures, accompanied by excellent commentaries, are numerous. It is therefore needful, when bringing before the public another Commentary—THE COMPREHENSIVE FAMILY BIBLE—to give some reason why it should have been produced. One general reason that might be urged is, that we never can have too many Commentaries; but besides this general reason it may be more specially noticed that an edition of the Scriptures seemed still to be wanting, which in ONE VOLUME, of elegant proportions and convenient size, should combine a *Text* printed in a type alike suitable for youth and age; a *Comment* so full as to meet the requirements of the greater number of readers, and accompanied by *Marginal References*, *Chronological* and other *Tables*, and *Indices*, and a *Series of Illustrations* of an interesting and really useful character: the whole forming, in the strictest sense, a "Comprehensive Family Bible." With a view to supply this want, the present edition has been prepared.

The TEXT has been printed from the most correct copies of the Authorized Version, and is accompanied by all the Marginal Readings usually printed therewith, and which form a very important part of the Translation.

The COMMENTARY has, in part, been for some years before the public, under the title of "The Pocket Commentary;" and in that form it has met with general approbation. This Comment was written with the special design of presenting in a condensed form, and in language intelligible to all classes, the most instructive and interesting Critical Illustrations of the Old and New Testaments. It has now been carefully revised, and much extended by the addition of such explanatory Notes as seemed necessary to adapt the Work to the requirements of the Family Circle and the humbler Christian. The aim has been to produce such an exposition of the Sacred Text as might lead the ordinary reader into a full understanding of his Bible.

The REFERENCES to parallel Texts will be very numerous and accurate, and will include the most valuable of those given by Blayney, Brown, Clarke, and Scott; and whenever space will permit, additional Notes will be given in the Reference columns.

The GENERAL INTRODUCTION will contain an outline of the Arguments for the Necessity of a Divine Revelation; the Fact of a Revelation; the Genuineness, Authenticity, and Inspiration of the Scriptures; Laws, Types, and Customs of the Jews; Geography and History of Nations, &c.

Numerous TABLES will be appended, suited to facilitate the Use of the Sacred Volume. These will include a Chronological Index; Tables of Weights, Measures, and Coins; the Jewish and Roman mode of Computing Time; Tables of Offices and Affinities of Kindred; a Chronological Arrangement of the Books of the Bible; a Tabular Arrangement of the Gospels as a Harmony, &c., &c. An improved and enlarged edition of Barr's invaluable INDEX OF SUBJECTS and CONCISE DICTIONARY OF TERMS, is in preparation as a SUPPLEMENT to the Book.

The ENGRAVED ILLUSTRATIONS will consist in part of Historical Subjects, carefully selected from the Ancient and Modern Masters; but the larger portion will consist of views of Mountains, Rivers, Lakes, and other Natural Scenery; together with Cities and Towns, existing or in ruins; Temples, Tombs, &c.; the whole having direct reference to Bible Incidents and History; and more especially illustrating the Fulfilment of Prophecy.

The work will be published in Parts at 2s. each, and will extend to about THIRTY-THREE Parts, exclusive of Supplement. The Parts will contain One and Two Engravings alternately, and with the concluding Part a FAMILY REGISTER, suited to bind up with the Work, will be given.

THE  
**POPULAR ENCYCLOPEDIA,**  
OR, "CONVERSATIONS LEXICON;"

Being a General Dictionary of Arts, Sciences, Literature, Biography, History, and Political Economy; with Dissertations on the Progress of Science, Literature, and the Fine Arts, by THOMAS THOMSON, M.D., F.R.S., &c., Regius Professor of Chemistry in the University of Glasgow; Sir DANIEL K. SANDFORD, D.C.L., &c., Professor of Greek in the University of Glasgow; and ALLAN CUNNINGHAM, Esq., author of "Lives of British Painters," &c. &c.

ILLUSTRATED BY NUMEROUS MAPS, PLATES, AND DIAGRAMS.

IN bringing out an edition of a work which has attained such unprecedented popularity on the Continent of Europe and the United States of America, the Publishers have spared no exertion or expense to render it worthy of British patronage. Their first object has been, to present the public with a *faithful edition of the original*, for it is upon that certainly, that the great claims of their publication to distinction must eventually rest. No work of similar dimensions has ever enjoyed so wide a popularity in Europe as the Conversations Lexicon; and with the knowledge of this fact, the Publishers have felt the propriety of retaining in their edition almost the entire original, in the persuasion that what has been so highly estimated elsewhere, can scarcely prove valueless in this country. The recommendation which it carries with it must be applicable to every quarter. This they felt more particularly when they came to prepare the work for the press. The information which it contained they found to be so new and complete,—so far surpassing in extent and freshness of source that of any British publication;—the method of arrangement and language they found to be so unexceptionable,—that they considered it would be worse than useless to remodel or materially alter the work, and that any affectation of doing so would be its condemnation. They, therefore, resolved to keep very faithfully to the original; and they are thus enabled to present the British public, *for the first time*, with an English edition of the Conversations Lexicon.

Nearly Two Hundred of the most eminent German writers contributed to the original work; and the American edition, upon which the present is formed, has been improved by a variety of original articles from eminent American writers, so that this edition will combine the excellencies both of the original and translated copies. To render it still more worthy of public favour, and especially to suit it to the wants and interests of this country, it is carefully revised, and such additions made to it as are considered necessary for the English reader. These, of themselves, (besides the Original Dissertations,) will constitute nearly one-fourth of the book, so that, independent of its cosmopolitan character, the reader may count on the fullest and most recent information on all subjects connected with the British empire.

In bestowing upon the present edition the title of THE POPULAR ENCYCLOPEDIA, the Publishers consider themselves justified, not only by the nature of the work, which is in every respect popular, being adapted to all tastes and necessities, but by the fact of its popularity, which exceeds that of any other work of the kind in Europe. More than *one hundred thousand* copies have been sold in Germany alone, and it is making equal progress throughout the other countries of Europe and the States of America. This fact may be considered as a guarantee of its usefulness. That nothing may be wanting to render the present edition acceptable, it is illustrated with Maps, Plates, and Diagrams, the want of these having been found the greatest desideratum in the former editions of the work.

"Perhaps two hundred thousand copies of the original work have been distributed through Europe, in different languages, since its publication; while probably not more than twenty-five thousand copies of the Library of Useful Knowledge have been disposed of. This fact alone is sufficient to convince us, that this age has produced nothing better fitted to the wants of society at large—to the necessities rather—for its circulation could not have been so extended, unless it had been regarded almost as a necessary of life."—*North American Review*.

# ITALY,

CLASSICAL, HISTORICAL, AND PICTURESQUE,

ILLUSTRATED IN A SERIES OF VIEWS FROM DRAWINGS

By STANFIELD, R.A., ROBERTS, R.A., HARDING, PROUT, LEITCH, BROCKEDON, BARNARD, &c. &c.  
 With DESCRIPTIONS OF THE SCENES. Preceded by an INTRODUCTORY ESSAY, developing the Recent History and Present Condition of Italy and the Italians. By CAMILLO MAPEI, D.D., formerly Canon of the Cathedral of Pavia, and Graduate of the College of San Apollinare in Rome.

In Great Britain, where the Scriptures are so generally perused, many of the early associations of childhood are connected with Rome. Before the young have learned fully to comprehend and appreciate the importance of the sacred records, their minds have been delighted by the interesting account given in the New Testament of the voyages of St. Paul, and of his captivity in the capital of the world. In a more advanced stage of their life, Rome and Italy are the daily subjects which occupy their thoughts, as they study the language of the conquerors of the world in the enchanting pages of a Virgil, of a Livy, or of a Tacitus. In later years early associations still accompany them,—the warlike history of the Republic and the Empire, mingled and softened by the mellow numbers of a Petrarch or a Tasso. Italy thus comes to be regarded by the educated mind with something of a passion, and with it are associated ideas of all that is beautiful in nature or art, profound in science, or great in literature. Every one finds something to interest him in the towns and history of Italy. To the merchant, a Venice or a Genoa is interesting as the ancient seat of a wide extended commerce; and an Amalfi as the place where that instrument was discovered which has since been the guide in all maritime exploration—the mariner's compass. The birth place of a Galileo is dear to the man of science, and that of a Raphael or a Michael Angelo to the lover of art; while the arena on which the Popes played their important part in the world's history,—on which the Waldenses stood firm and suffered,—and on which a Napoleon first gained a wide extended military fame, is interesting alike to all who love to contemplate the progress of their species as developed in the history of bygone times.

ITALY,—CLASSICAL, HISTORICAL, and PICTURESQUE, consists of a series of views of Italian Towns and Scenery, engraved in the first style of art, from Drawings by the leading landscape painters of Great Britain. The views selected for representation are of places all interesting, either from historical associations, or from the natural beauties which they exhibit. Among them are found views of many places seldom visited by the tourist, and which come before the public with a pleasing freshness from never before having been engraved in this country.

The views are accompanied by letter-press descriptions, noticing the remarkable points of history, &c., connected with each; and the whole is preceded by an Introductory Essay by Dr. CAMILLO MAPEI, in which the later history of the Italians is treated of, but more especially the present state of the ITALIAN PEOPLE and the ITALIAN MIND.

"Of the whole work we can say that in pictorial interest, excellence of engraving, and the style of the descriptive letter press, we never met with any work on Italy more satisfactory. It is one of the cheapest publications of modern times."—*Art Union*

"This is a splendid work."—*Asiatic Journal*.

"As a refresher of the memories of all who have passed the Alps and are impatient of seeing the beauties of Italy desecrated by the mechanical or trivial nature of their presentment, this publication deserves all honour."—*Athenaeum*.

"The subjects of the engravings are chosen with judgment."—*The Times*.

"A work full of value, and illustrated with great beauty."—*Atlas*.

"This is the most voluptuously adorned and printed guide book that ever became candidate for the patronage of the boudoir or the tourist."—*Cont Journal*
